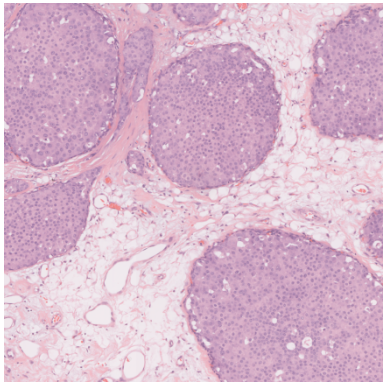
Virtual Slide 44200 X 58600 pixels

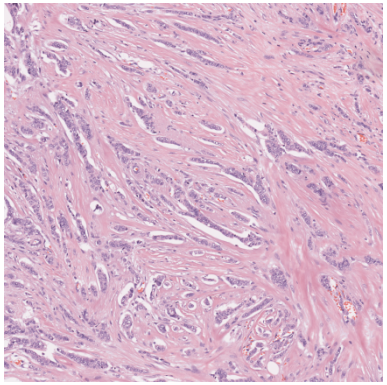
Breast tissue - Haematoxylin & Eosin stain

Context

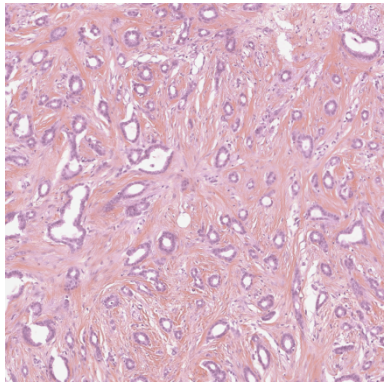
Breast Cancer Histopathology



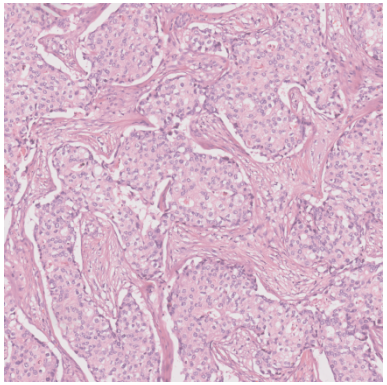
Ductal carcinoma in situ - 13%



Invasive lobular carcinoma - 5%



Tubular carcinoma - 4%



Medullary carcinoma - 3%

more subtypes: Cribriform carcinoma, Mucinous carcinoma, Papillary carcinoma, Micropapillary carcinoma, Apocrine carcinoma, Metaplastic carcinomas, Inflammatory carcinoma, etc…

55% of breast tumors do not have the "specific differentiating features"
a.k.a. Invasive carcinoma of no special type (NST)

High architectural heterogeneity

- Quantitative evaluation of tissue
- New tissue-derived parameters

Tumor patterns: Density, Size, Shape, Morphology, Sparsity, Relative distance

[2] Sinn HP et al. "**A brief overview of the WHO classification of breast tumors**". Breast Care 8 (2013)

Context

Tumor Micro-Environment (TME)

Immune cell

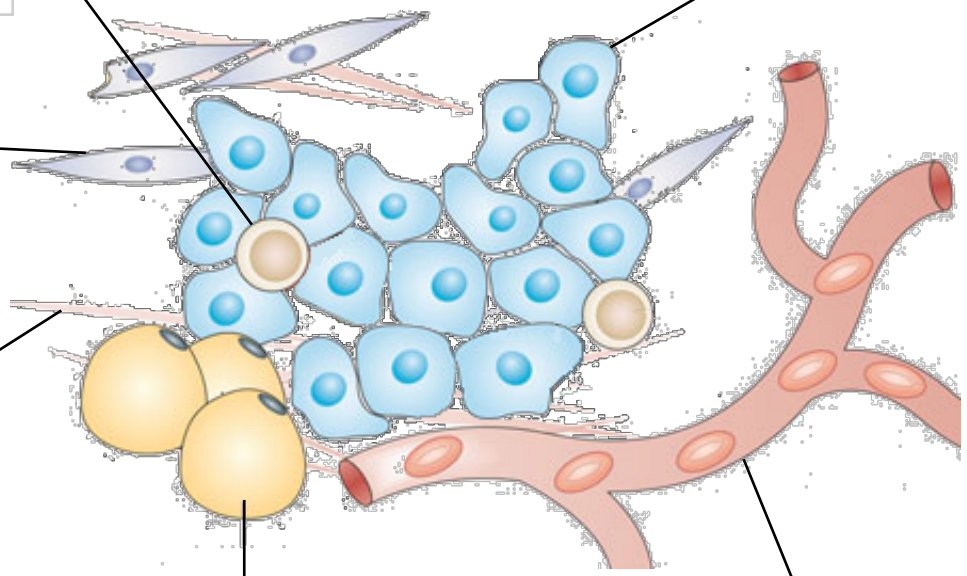
may potentially **attack** cancer cells [4]

Fibroblast

may **drive** the progression of cancer metastasis [5]

Collagen

cancer cell invasion **oriented** along aligned collagen fibres [7]



Tumor Cell

Adipocyte

fuel the growth of malignant cells [6]

Blood Vessel

supply tumor cells with oxygen and nutrients [8]

1) Graph-based methods in histopathology

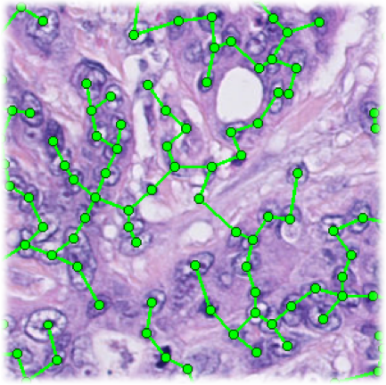
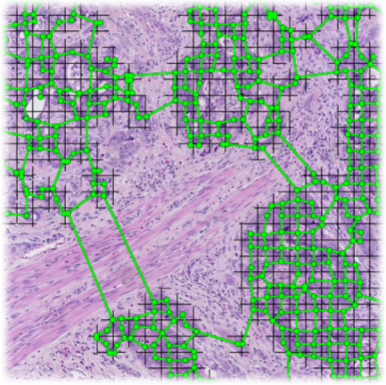
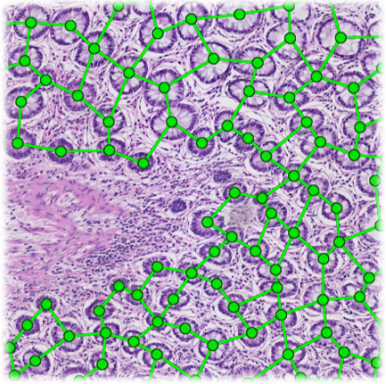
Histological Objects:



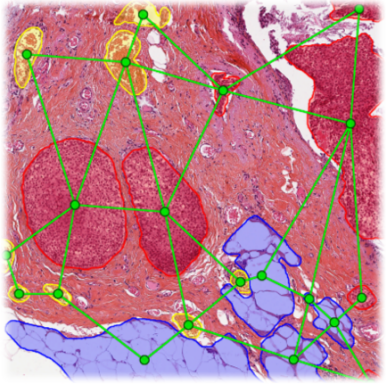
Cell Nuclei



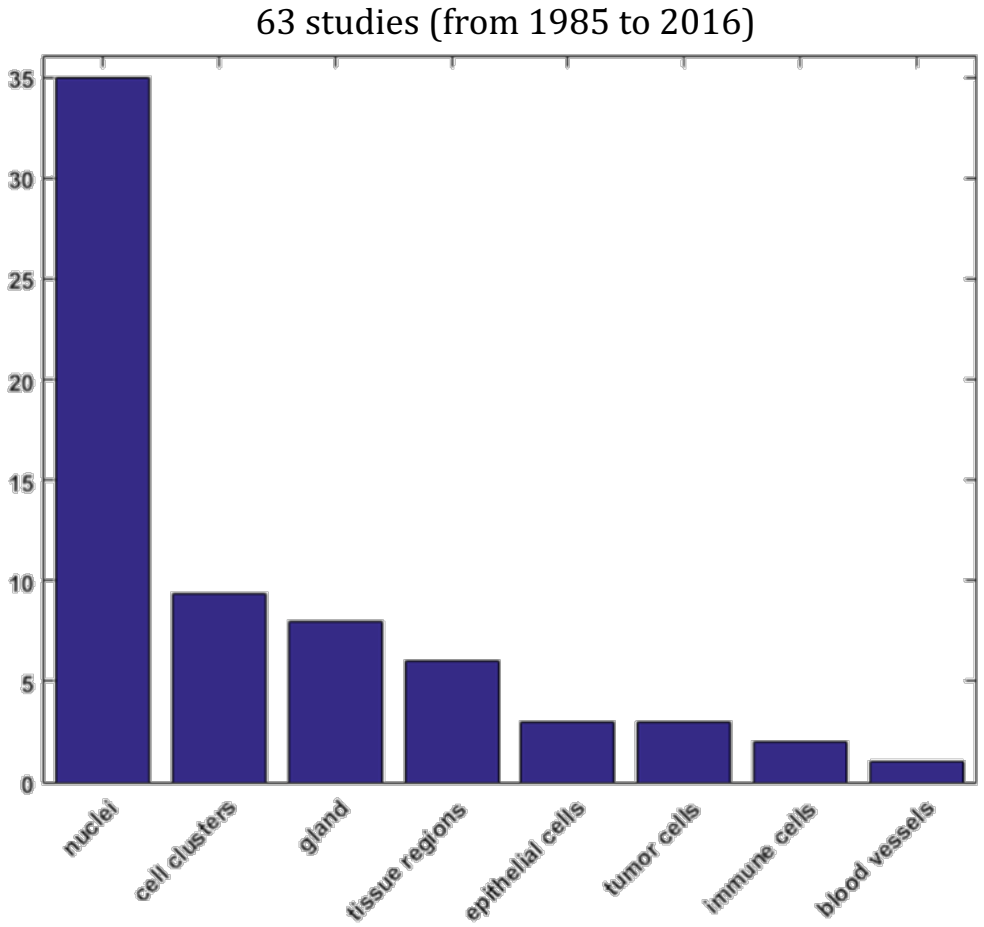
Cell clusters



Glands

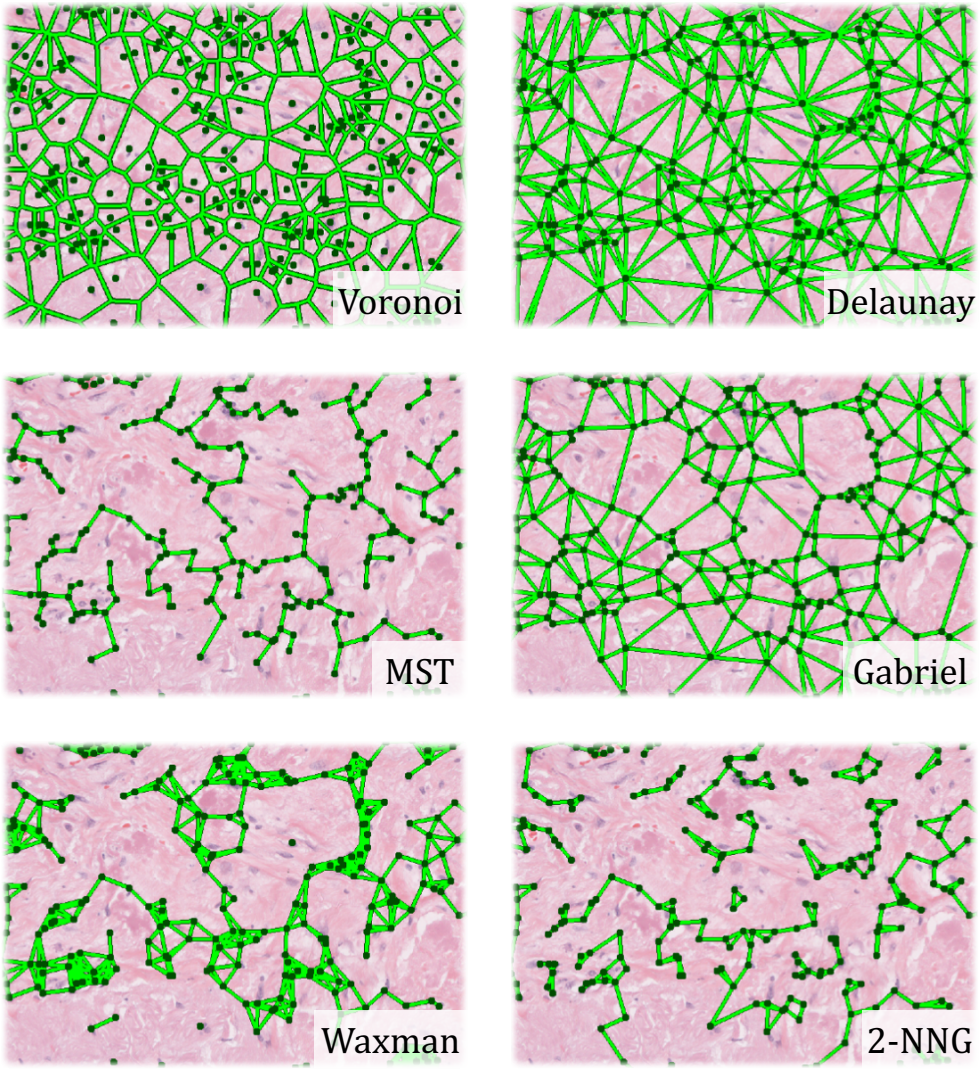


Tissue regions



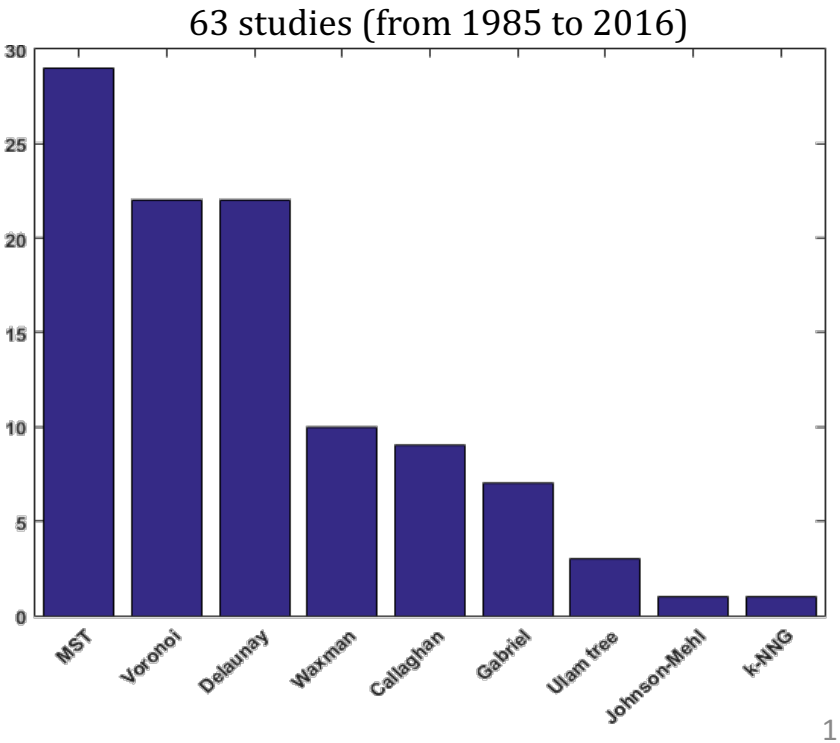
1) Graph-based methods in histopathology

Graph types:



- Delaunay = dual(Voronoi)
- MST ⊆ Gabriel ⊆ Delaunay

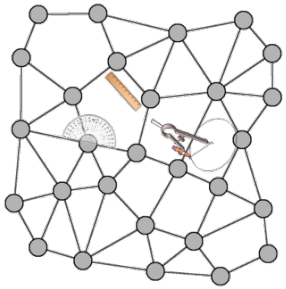
➔ Different degrees of connectedness based on geometric rules



1) Graph-based methods in histopathology

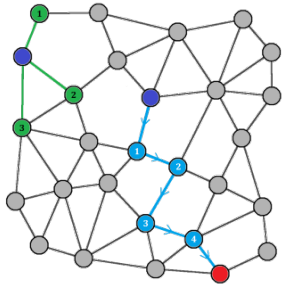
Feature extraction:

1) Syntactic Structure Analysis



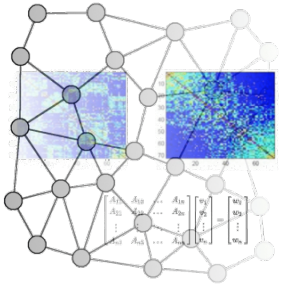
- Polygon area
- Polygon perimeter
- Polygonal size
- Polygon shape
- Polygon roundness
- Polygon compacity
- Polygon density
- Minimal to maximal side length
- Edge length
- chord length
- Minimum angle
- Maximum angle
- Nearest neighbor distance
- Distance to the k-nearest neighbors
- Nbr. of neighbors within a disk of radius r
- Weighted compacity
- Divergence from the regular number tree

2) Network Analysis



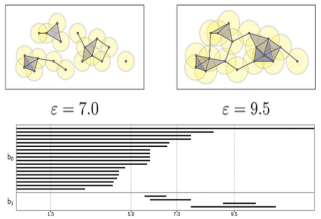
- Order
- Size (nbr. of edges)
- Average degree
- Average eccentricity
- Radius (min. ecc.)
- Diameter (max. ecc.)
- Clustering coefficient
- Closeness
- Nbr. of conn. comp.
- Giant conn. comp.
- Nbr. of isolated nodes
- Nbr. of nodes with k neighbors
- Nbr. of central vertices
- Nbr. of spanning trees
- Betweeness
- Rich club coefficient
- Cyclomatic number
- Persitence
- Girth
- Expansion

3) Spectral Analysis



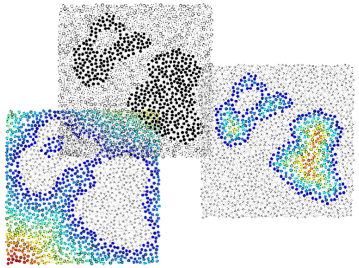
- Spectral radius
- Fiedler vector
- Cheeger constant
- Algebraic connectivity
- Principal eigenvector
- Nbr. of eigenvalues
- Second largest absolute value of eigenvalues
- Eigen exponent
- Energy
- Lower slope
- Nbr. of eignervalues equal to 1
- Nbr. of eignervalues equal to 2
- Upper-slope
- Trace
- Eigenmode perimeter
- Eigernmode volume

4) Persistent Homology

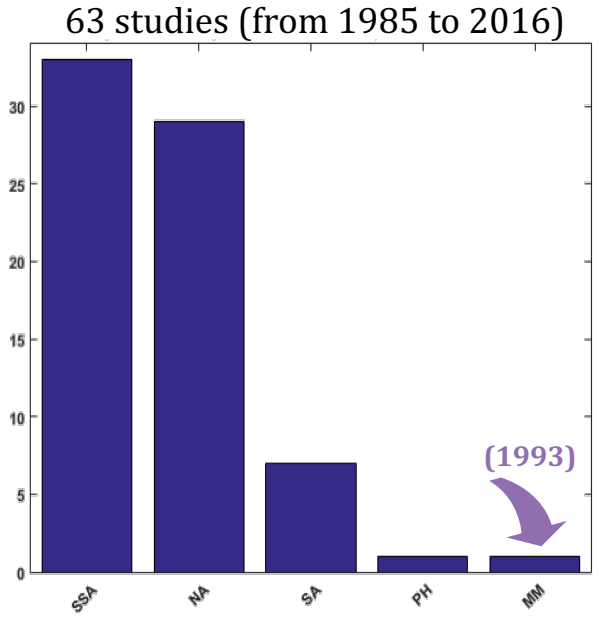


- Betti numbers

5) Mathematical Morphology



- Distance transform
- Granulometry



[10] Raymond E. et al. "Germinal center analysis with the tools of mathematical morphology on graphs". Cytometry (1993)

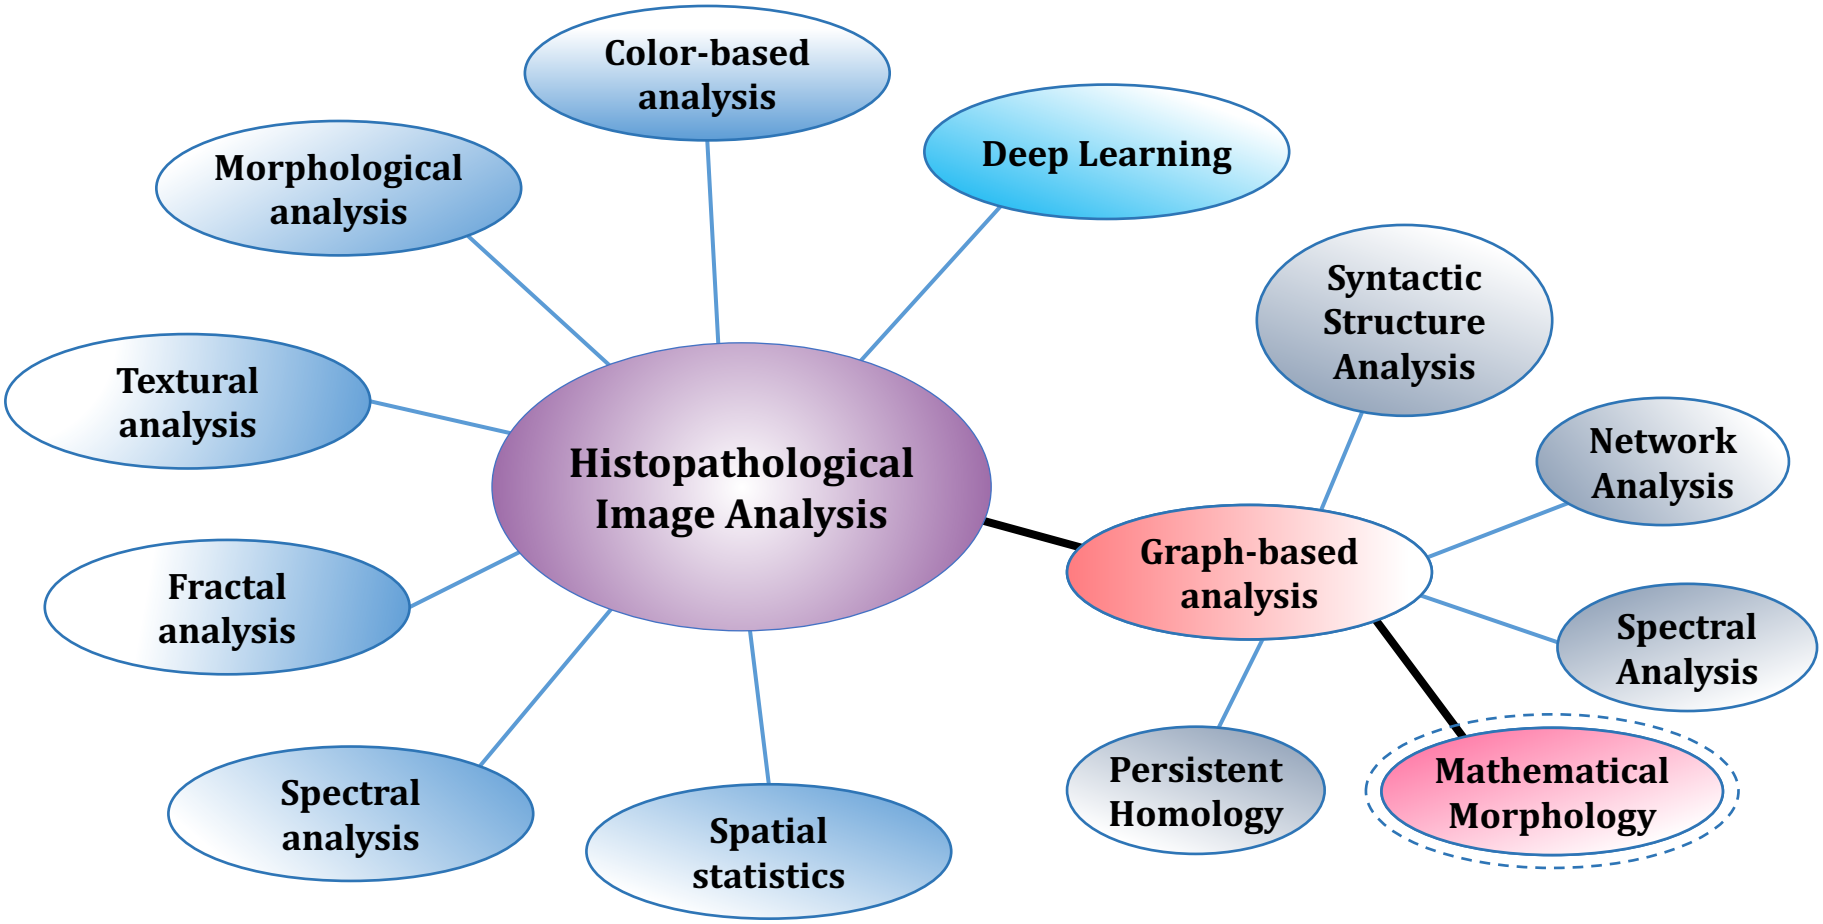
1) Graph-based methods in histopathology

Limitations:

- Analysis limited to small ROI/image frames
- Imprecision in nuclei detection/manual annotation
- Cells are treated indiscriminately
- High computational cost of some features

Requirements:

- Global analysis: Whole Slide Image
- Heterotypic spatial interactions (TME)
- Nuclei detection & classification
- More holistic approaches for feature extraction

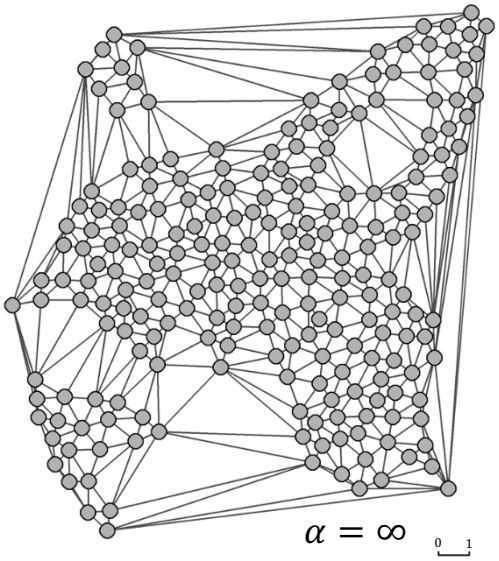


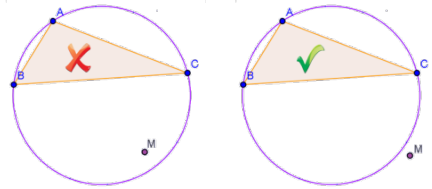
Color-based analysis
Morphological analysis
Deep Learning
Textural analysis
Histopathological Image Analysis
Syntactic Structure Analysis
Network Analysis
Graph-based analysis
Fractal analysis
Spectral Analysis
Spectral analysis
Spatial statistics
Persistent Homology
Mathematical Morphology

2) Spatial Point Analysis using Mathematical Morphology

Graph reconstruction:

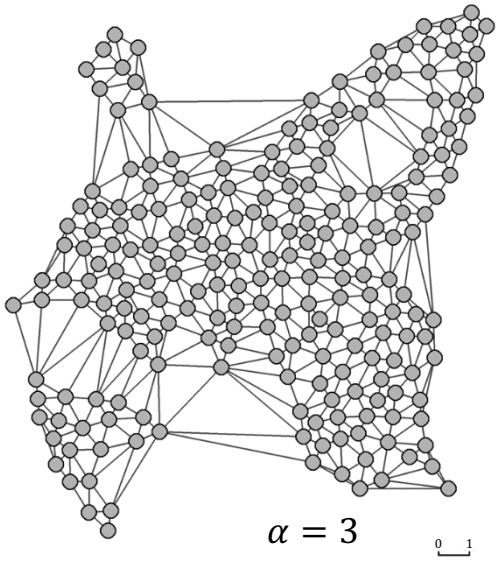
Delaunay graph:

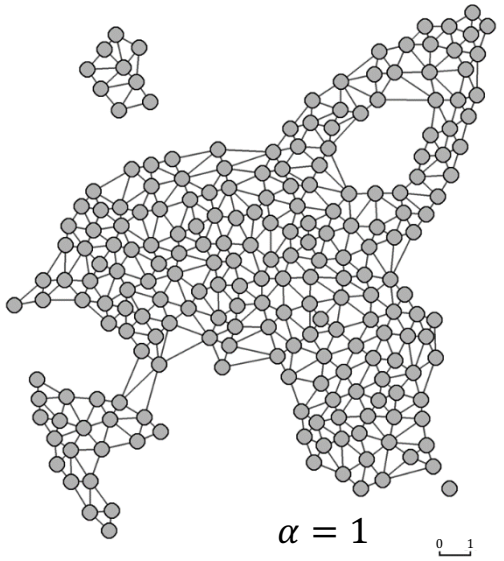


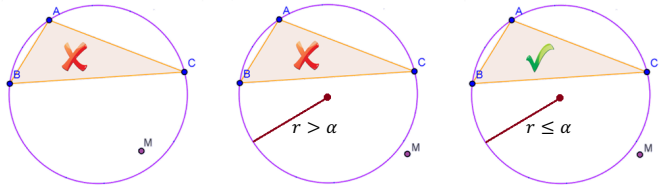


➔High degree of connectedness
➔Distant points may be connected

α-Shape filtering: sculpting Delaunay graph



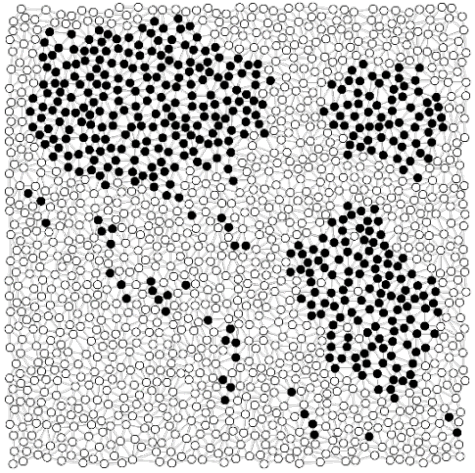




➔High degree of connectedness
➔~~Distant points may be related~~

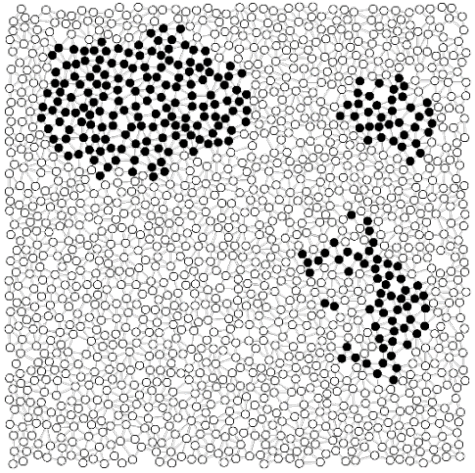
2) Spatial Point Analysis using Mathematical Morphology

Mathematical Morphology on Graphs:

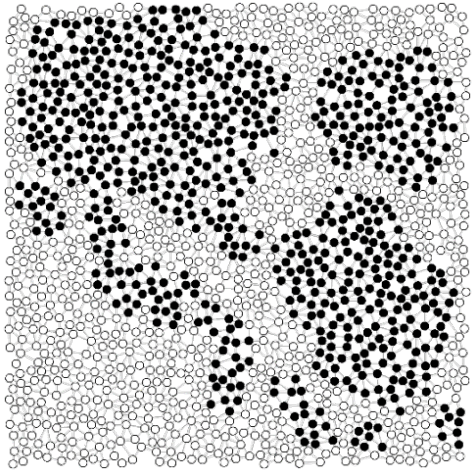


Binary graph: $G(V, E)$

$\circ = 0$, $\bullet = 1$



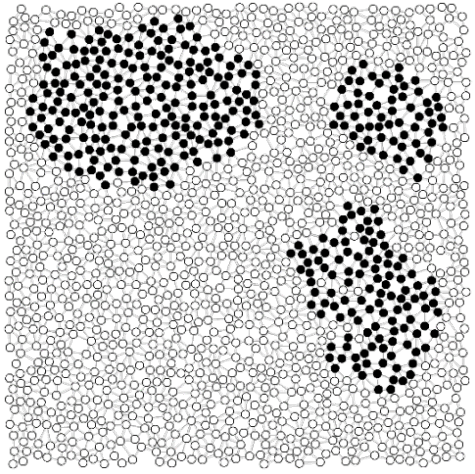
Erosion $\varepsilon_1(G)$



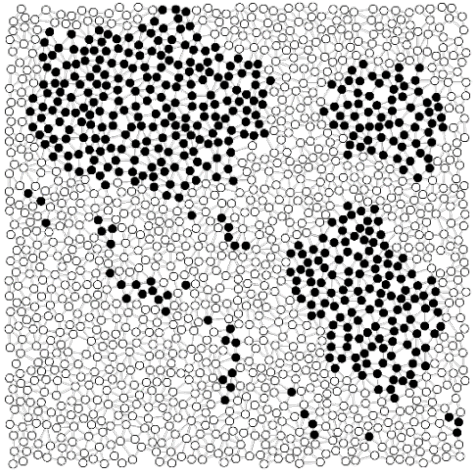
Dilation $\delta_1(G)$

$\forall\, v \in V$,

- $\varepsilon_n(G)(v) = \min\{G(v), d_E(u, v) \leq n\}$
- $\delta_n(G)(v) = \max\{G(v), d_E(u, v) \leq n\}$
- $\gamma_n(G) = \delta_n \circ \varepsilon_n(G)$
- $\varphi_n(G) = \varepsilon_n \circ \delta_n(G)$



Opening $\gamma_1(G)$

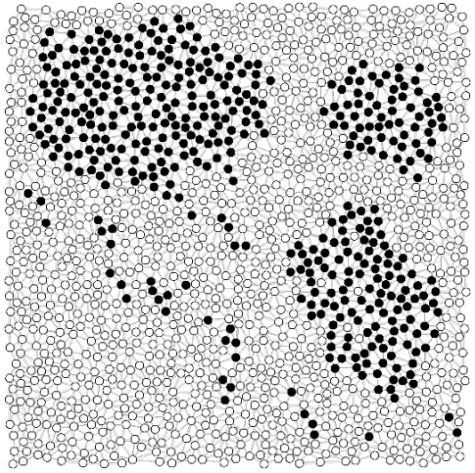


Closing $\varphi_1(G)$

[11] Luc Vincent, "**Graphs and Mathematical Morphology**", Signal Processing, 1989.

2) Spatial Point Analysis using Mathematical Morphology

Mathematical Morphology on Graphs:



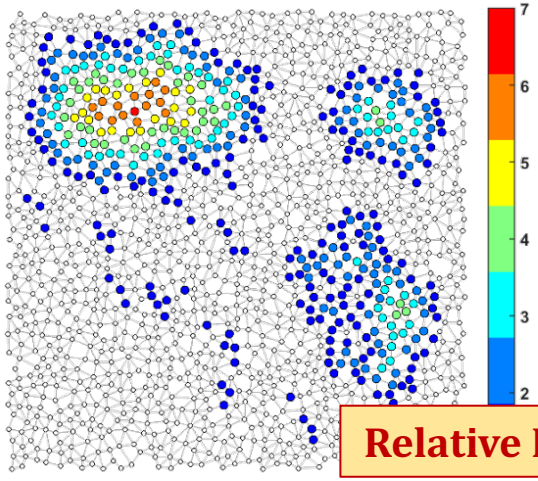
Binary graph: $G(V,E)$

$\circ = 0\,,\ \bullet = 1$

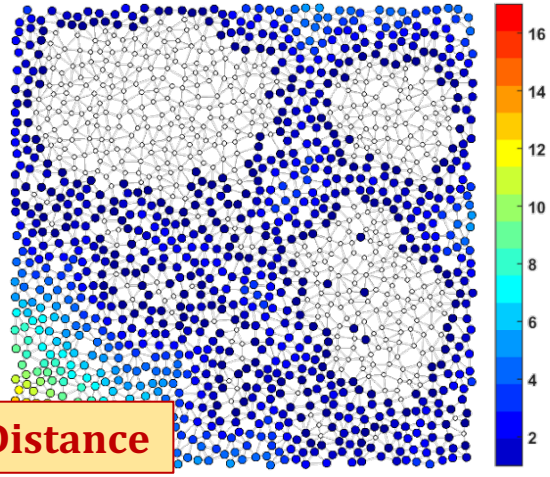
$$D(G) = \sum_{n=0}^{k} \varepsilon_n(G) \quad with \quad \varepsilon_k(G) = \varepsilon_{k'}(G), \qquad \forall k' \geq k$$

$$\Omega(G) = \sum_{n=0}^{k} \gamma_n(G) \quad with \quad \gamma_k(G) = \gamma_{k'}(G), \qquad \forall k' \geq k$$

$$\zeta(G) = \sum_{n=0}^{k} \varphi_n(G) \quad with \quad \varphi_k(G) = \varphi_{k'}(G), \qquad \forall k' \geq k$$

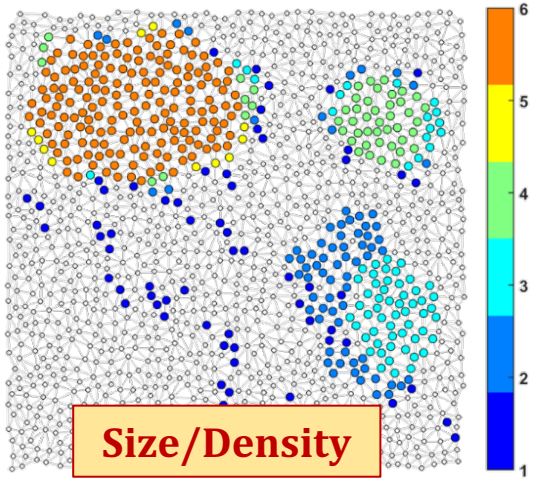


Distance map $D(G)$



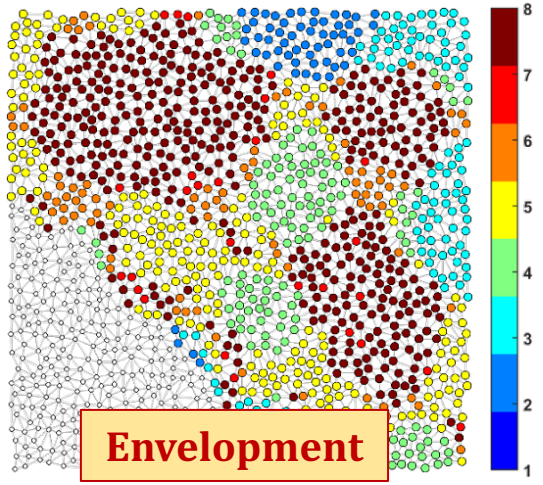
Distance map $D(\bar{G})$

Relative Distance



Openness $\Omega(G)$

Size/Density



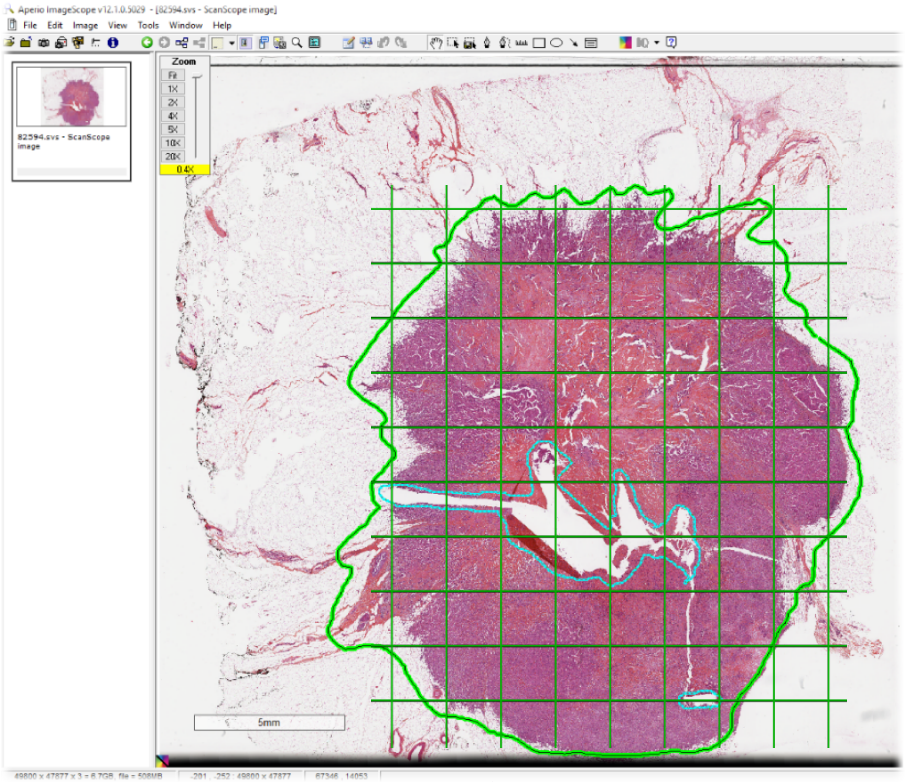
Closeness $\zeta(G)$

Envelopment

3) Node Identification

Data:

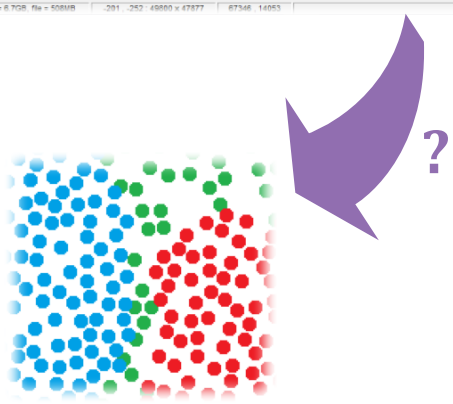
- 55 WSIs (breast cancer)
- Hematoxylin-Eosin-Saffron (HES),
- Aperio ScanScope CS (20X objective)
- Resolution: 0.5 $\mu m/pixel$.



Framework:

HES image tile

(1024×1024)

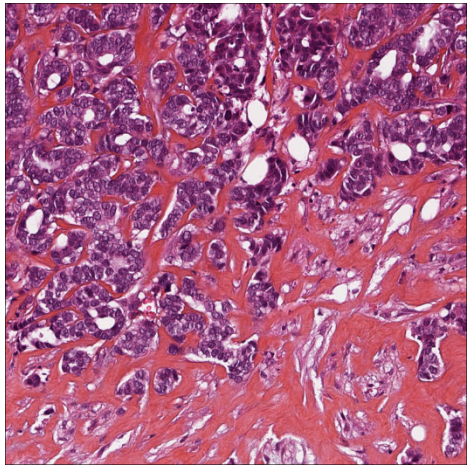


3) Node Identification

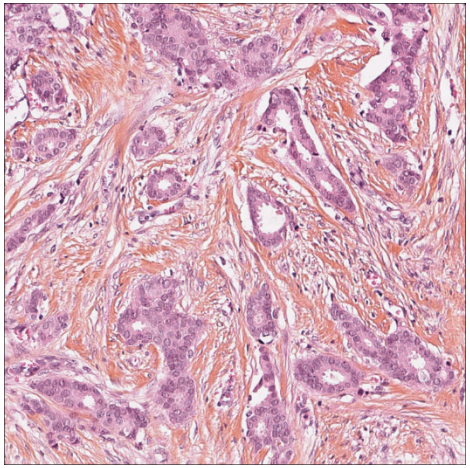
Preprocessing: color normalization

Reinhard:

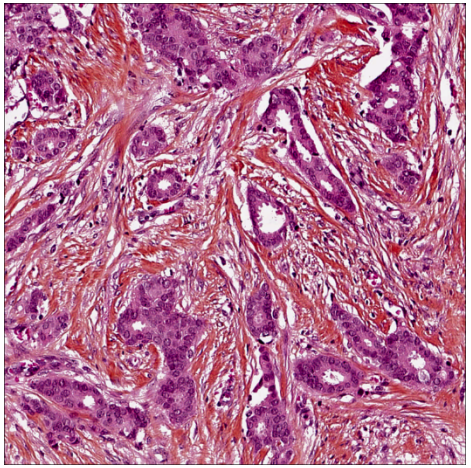
$$I_{norm}^{(i)} = (I_{source}^{(i)} - \mu_{source}^{(i)}) \frac{\sigma_{target}^{(i)}}{\sigma_{source}^{(i)}} + \mu_{target}^{(i)}, \quad i \in \{L, a, b\}$$



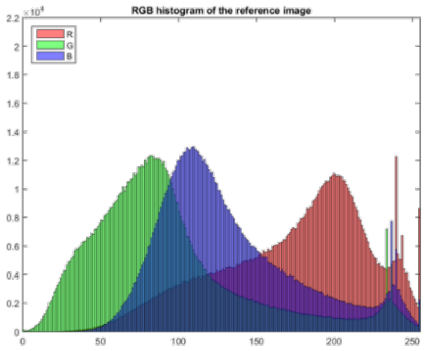
Reference image

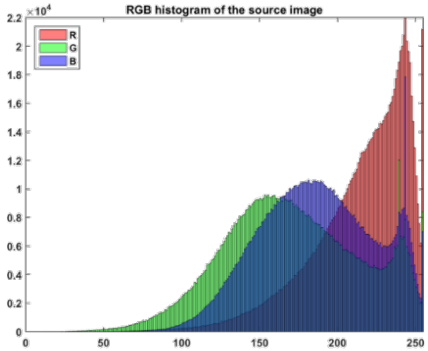


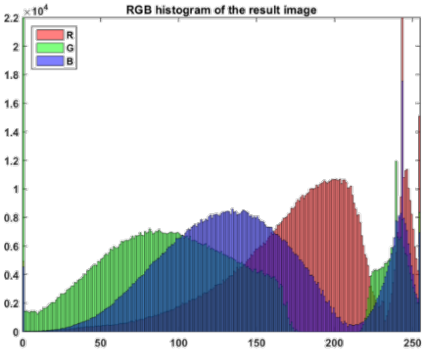
Under-stained image



Normalized image







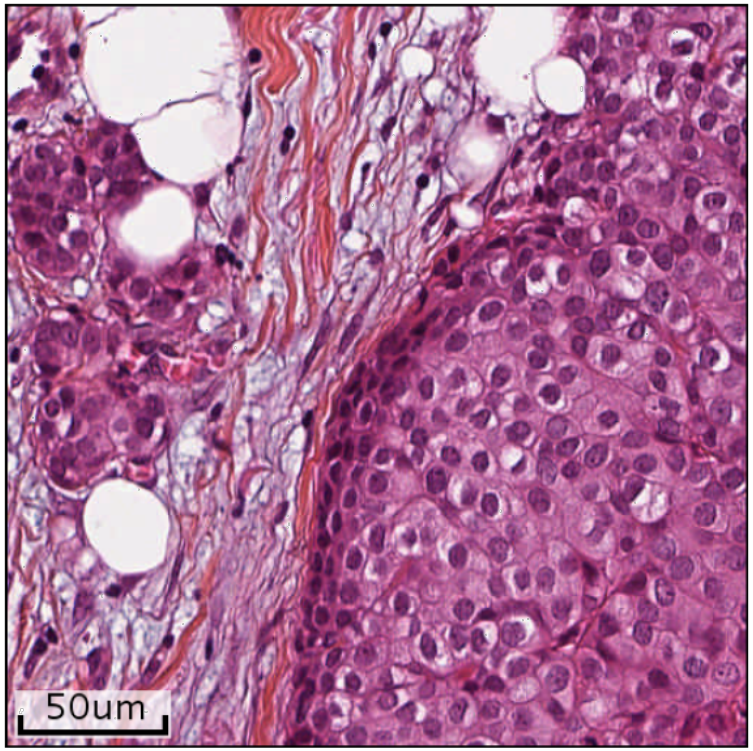
[12] Reinhard E. et al. "**Color transfer between images**". IEEE Computer graphics and applications (2001)

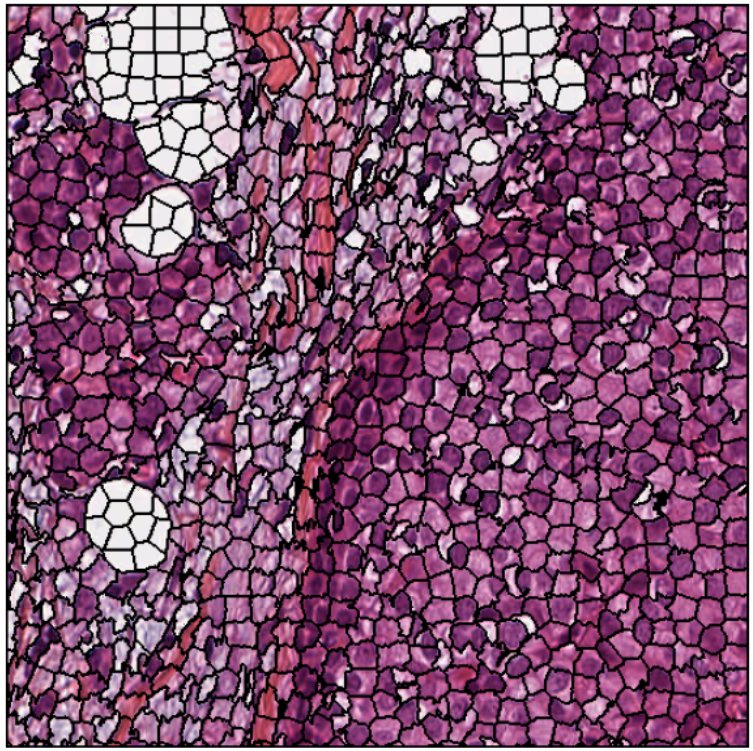
3) Node Identification

Preprocessing: superpixel segmentation

Simple Linear Iterative Clustering (SLIC):

- number of superpixels: 3500
- compact factor: 35

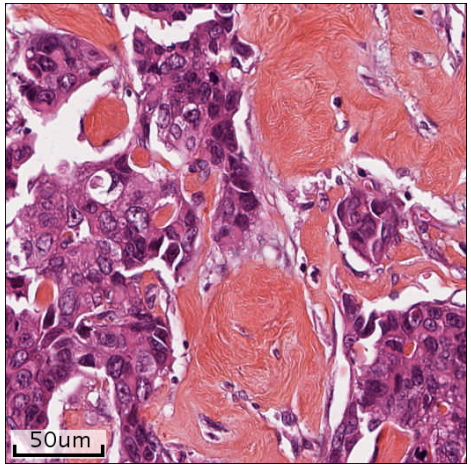




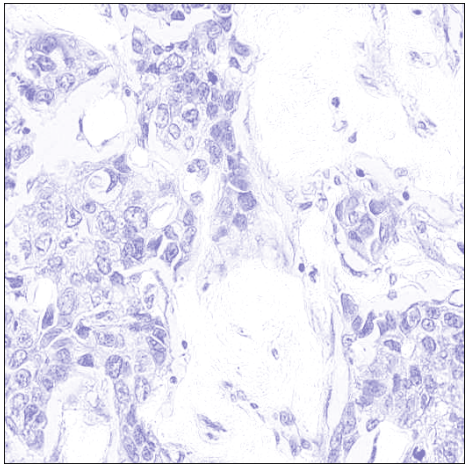
[13] Achanta R. et al. "**SLIC Superpixels**". EPFL Technical Report no. 149300 (2010)

3) Node Identification

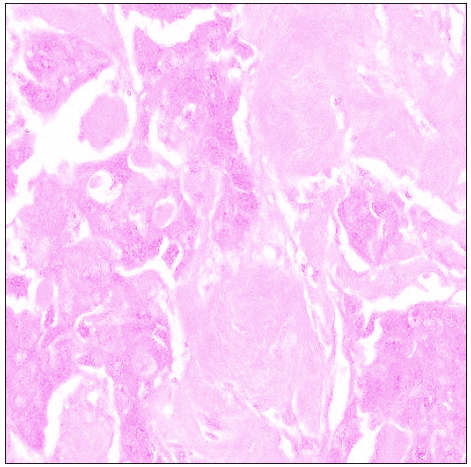
Nuclei detection: color deconvolution



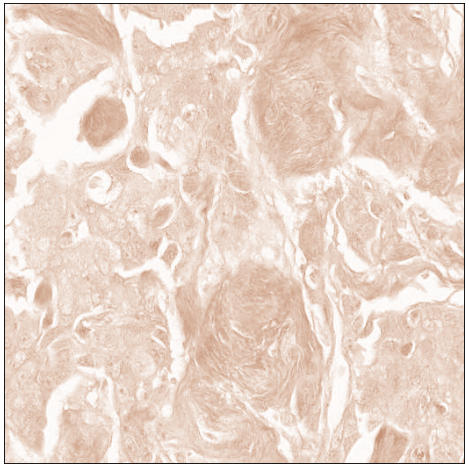
HES



Haematoxylin (H)



Eosin (E)



DAB (~S)

- Separation of histochemical staining

$$\begin{bmatrix} H_x \\ E_x \\ DAB_x \end{bmatrix} = OD^{-1} \times \begin{bmatrix} -log(\frac{R_x+1}{256}) \\ -log(\frac{G_x+1}{256}) \\ -log(\frac{B_x+1}{256}) \end{bmatrix}$$

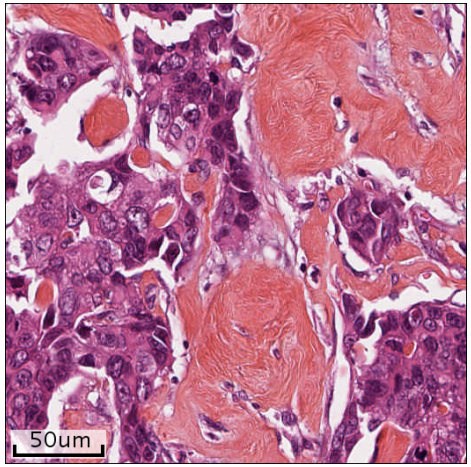
$$OD = \begin{bmatrix} 0.65 & 0.70 & 0.29 \\ 0.07 & 0.99 & 0.11 \\ 0.27 & 0.57 & 0.78 \end{bmatrix} \begin{matrix} \leftarrow \text{H} \\ \leftarrow \text{E} \\ \leftarrow \text{DAB} \end{matrix}$$

Optical density matrix

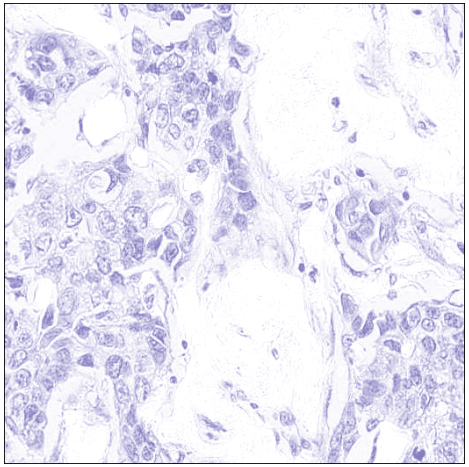
[14] Ruifrok A.C. et al. "**Quantification of histochemical staining by color deconvolution**". In: Analytical and quantitative cytology and histology (2001)

3) Node Identification

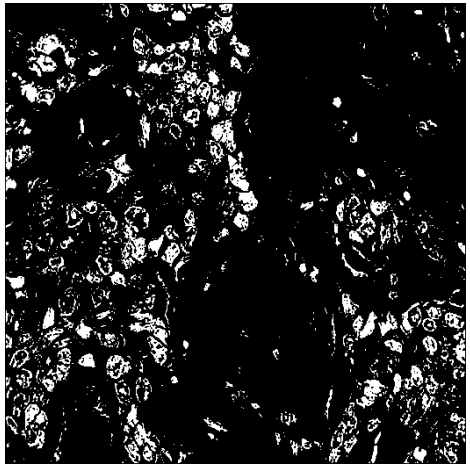
Nuclei detection: superpixel selection



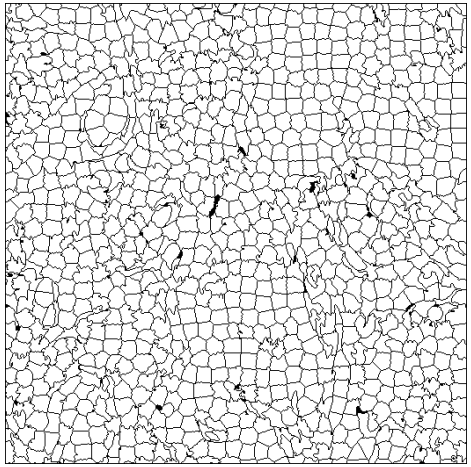
HES



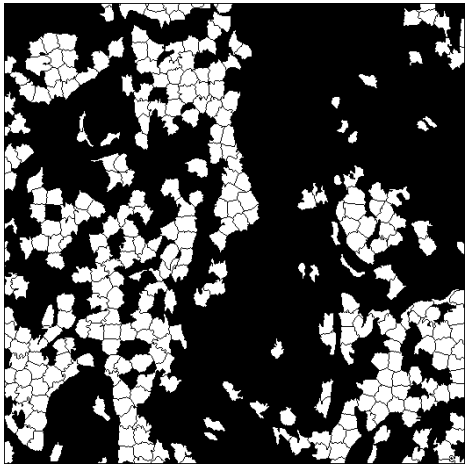
Haematoxylin (H)



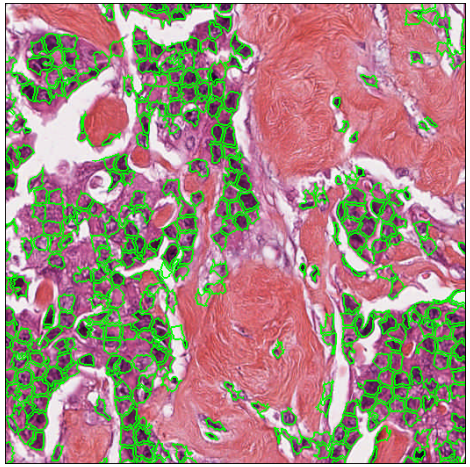
$Open_{R_d}(H > T_h)$ ← $R_d?\,;T_h?$



SLIC

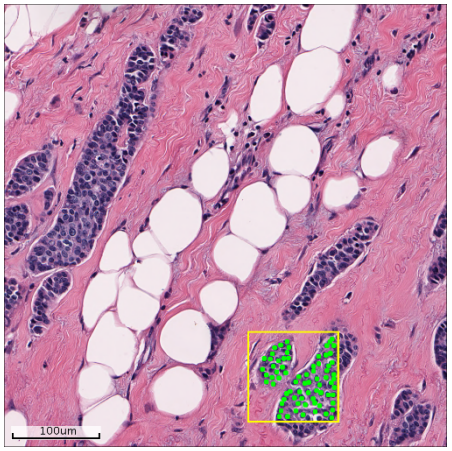


$Rec\left(Open_{R_d}(H > T_h), SLIC\right)$

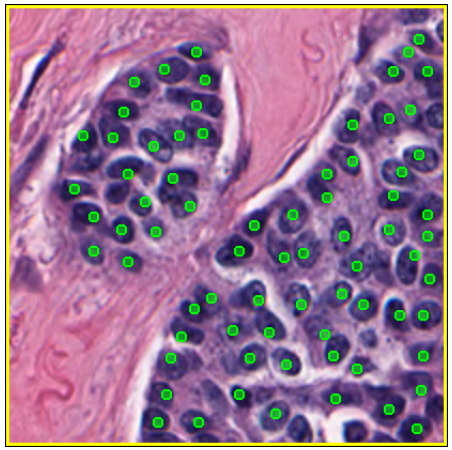


3) Node Identification

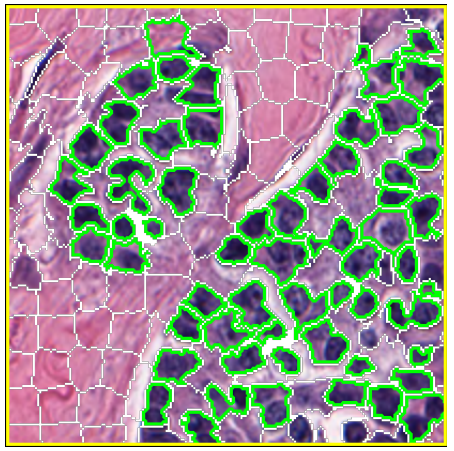
Nuclei detection: superpixel selection



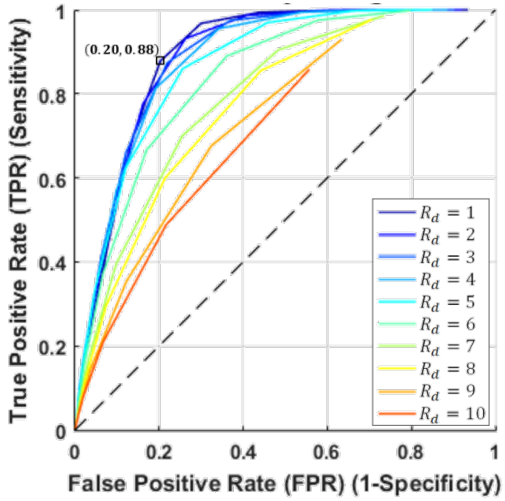
Dataset [14]



Ground Truth



Superpixel Ground Truth



- 512 images (color normalization)
- 17 294 nuclei ⇒ 14 830 (+) superpixels
  71 191 (−) superpixels
  } within the validation ROIs

➔ $R_d = 1$ and $T_h = 0.6$

F-score	Precision	Recall	Specificity	Accuracy
0.60729	0.46406	0.87843	0.7971	0.81065

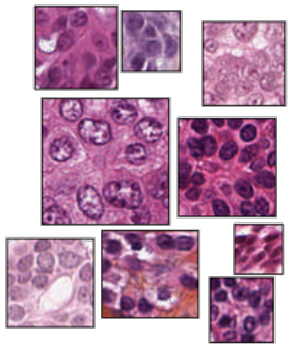
(50% training | 50% testing)

0.8449 [14]

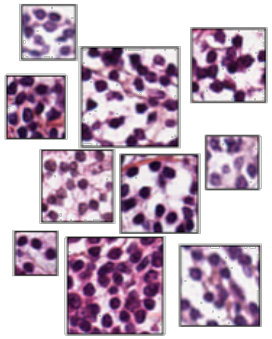
[15] Xu J. et al. "**Stacked sparse auto-encoder (SSAE) for nuclei detection on breast cancer histopathology images**". IEEE trans. on medical imaging (2016)

3) Node Identification

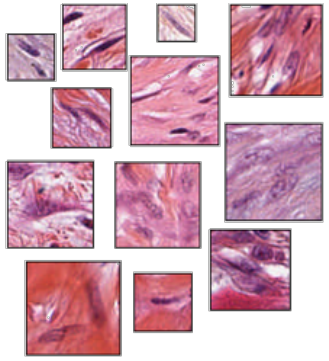
Nuclei classification:



Cancer cells



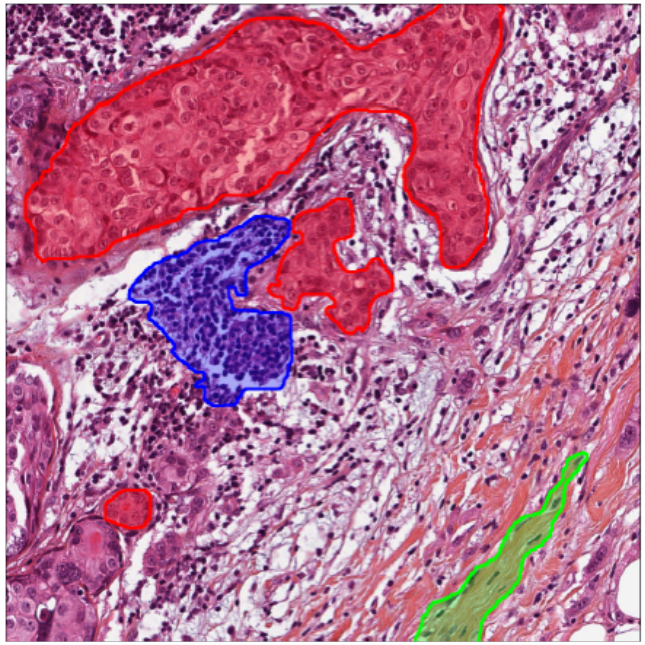
Immune cells



Fibroblasts

- 17 WSI
- 2533 regions
  ⇒ 1005 (1024×1024) images

Cell type	Nbr. of detected nuclei within the annotated areas
Cancerous	77676
Immune cell	31037
Fibroblast	3412
Total	**112125**



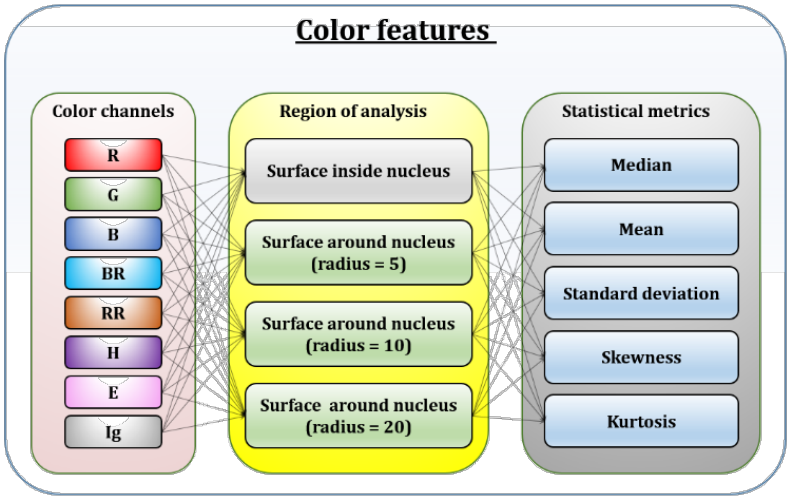
Cancer cells

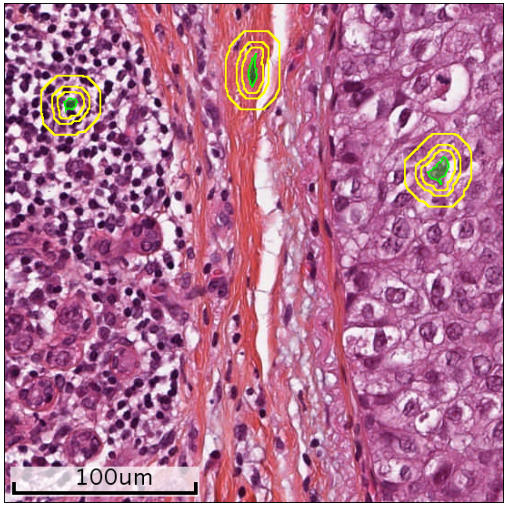
Immune cells

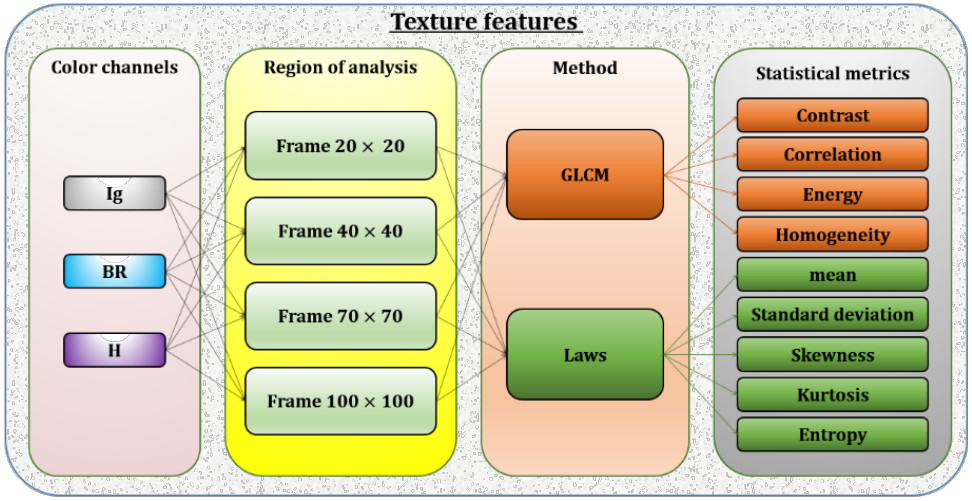
Fibroblasts

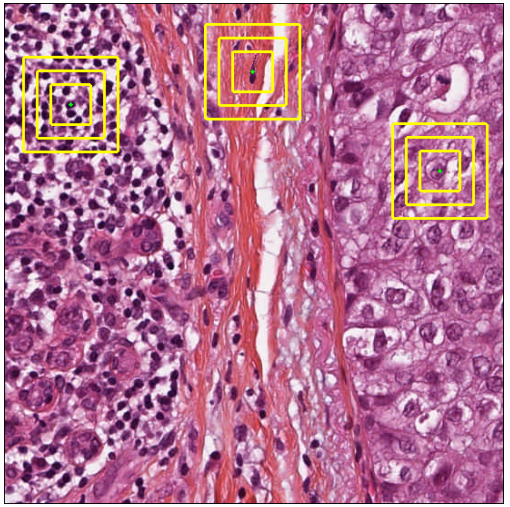
3) Node Identification

Nuclei classification: feature extraction









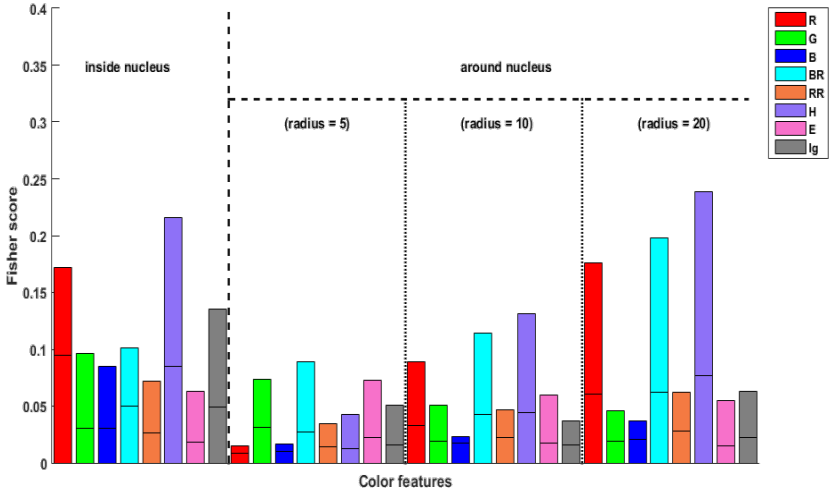
3) Node Identification

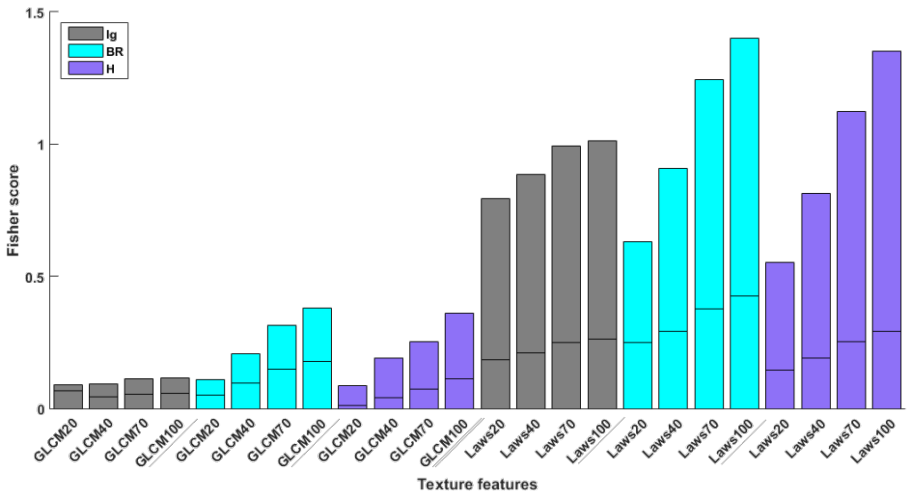
Nuclei classification: feature selection

- 160 color features per nucleus
- 1092 texture features
  - 900 Laws features
  - 192 GLCM features

➔ **1252 features per nucleus**

Fisher method: $$F_s = \frac{\sum_{k=1}^{K} n_k(\mu - \mu_k)^2}{\sum_{k=1}^{K} n_k \sigma_k^2}$$





➔ **337 features per nucleus**

3) Node Identification

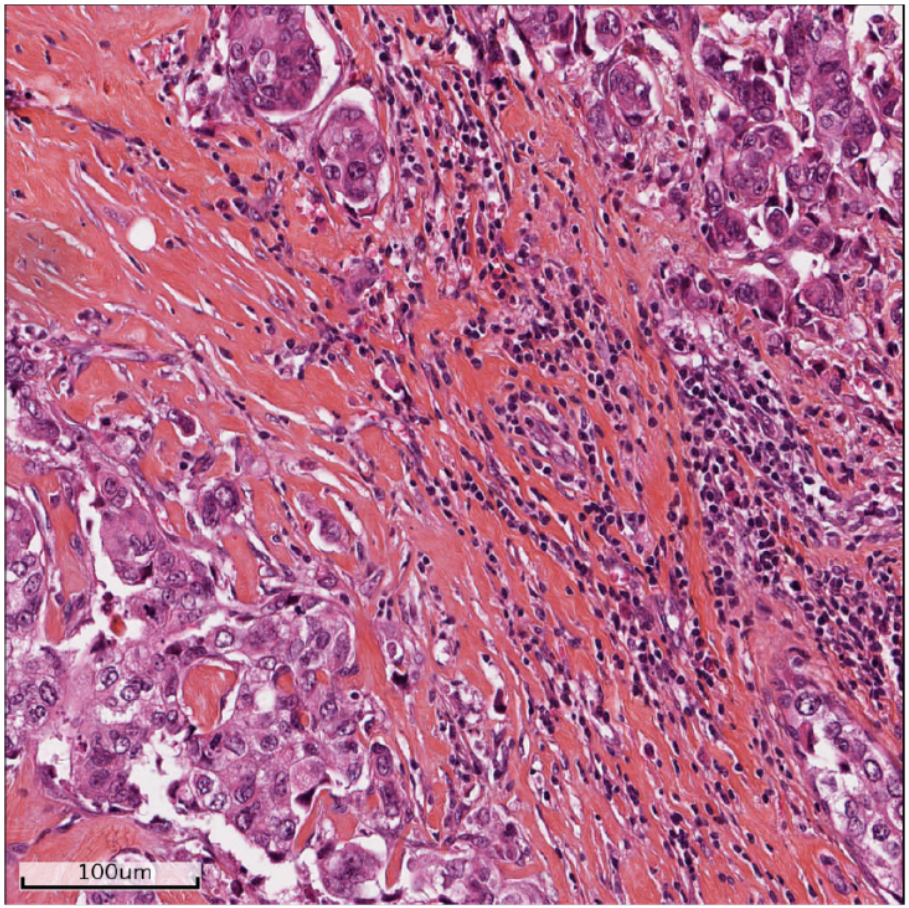
Nuclei classification: Random Forest

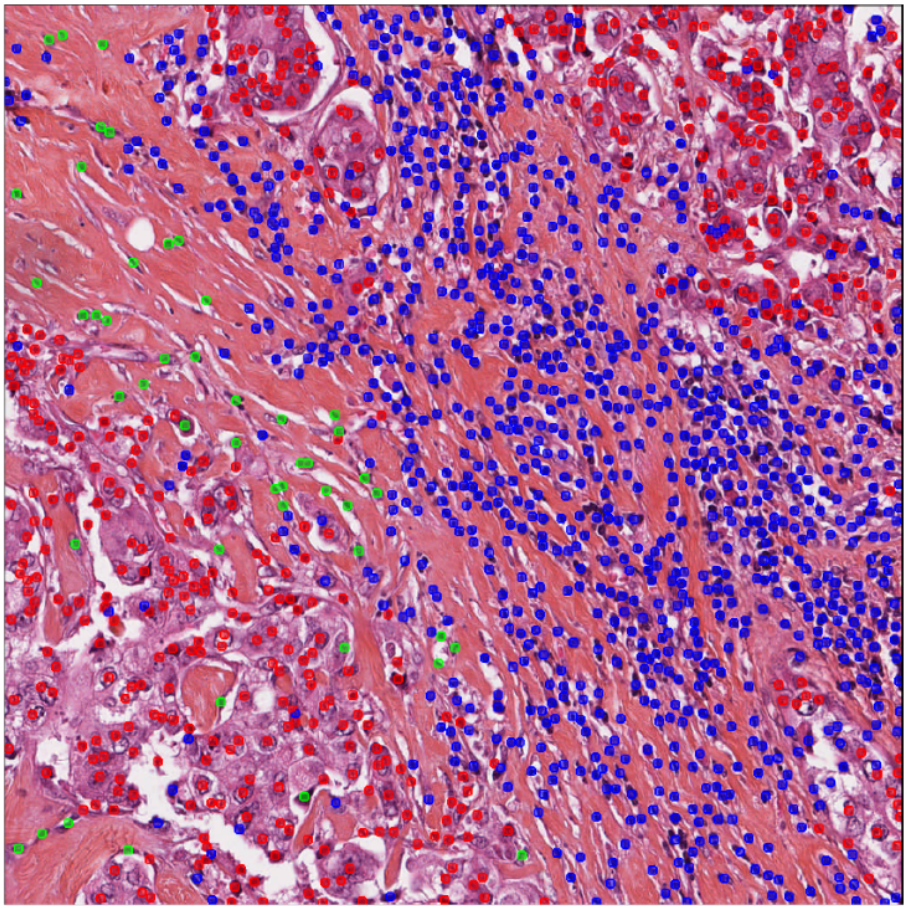
Average over 10-fold cross validation

Accuracy_M	Precision_M	Recall_M	Specificity_M	$F_1\text{-score}_M$
0.9784	0.9383	0.8745	0.9737	0.9053

Confusion Matrix

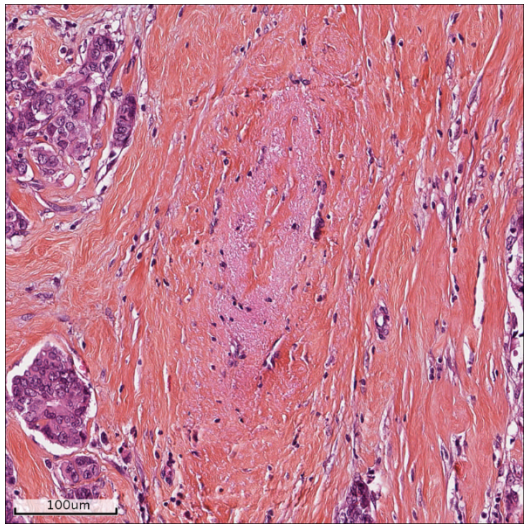
Actual class \ Predicted class	Cancer cells	Immune cells	Fibroblasts
Cancer cells	**68858** (98.50%)	901 (1.29%)	149 (0.21%)
Immune cells	1087 (3.89%)	**26705** (95.60%)	142 (0.51%)
Fibroblasts	771 (25.11%)	187 (6.09%)	**2113** (68.80%)



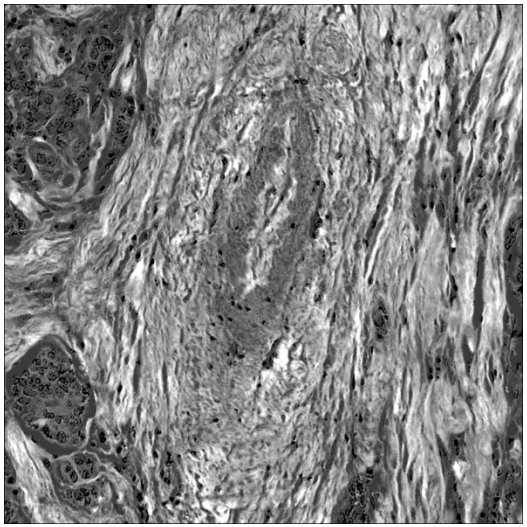


3) Node Identification

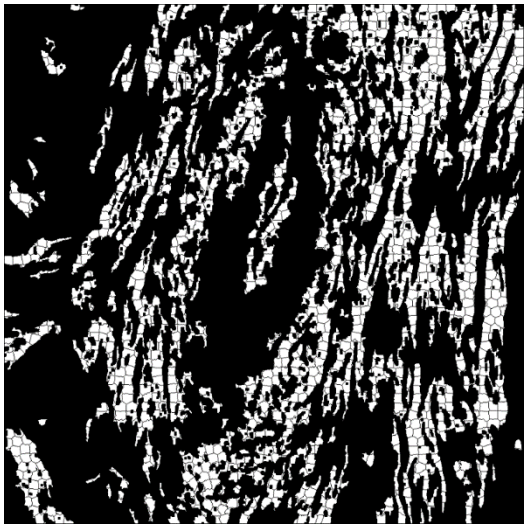
Collagen segmentation:



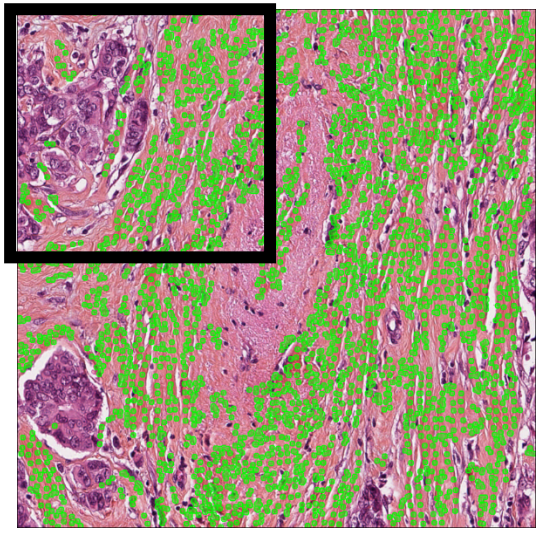
HES

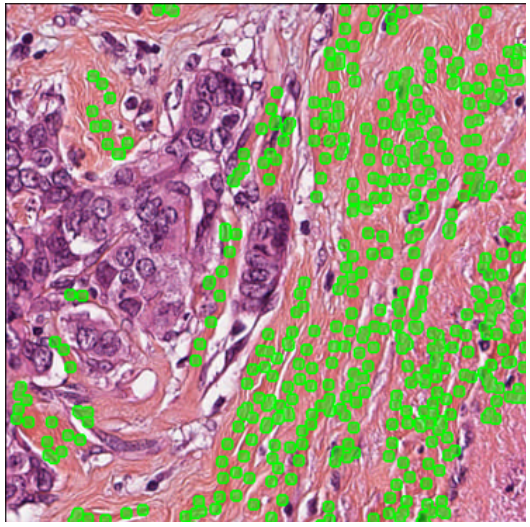


I_{RR}



$Rec(Open_2(I_{RR} > 0.5), SLIC)$



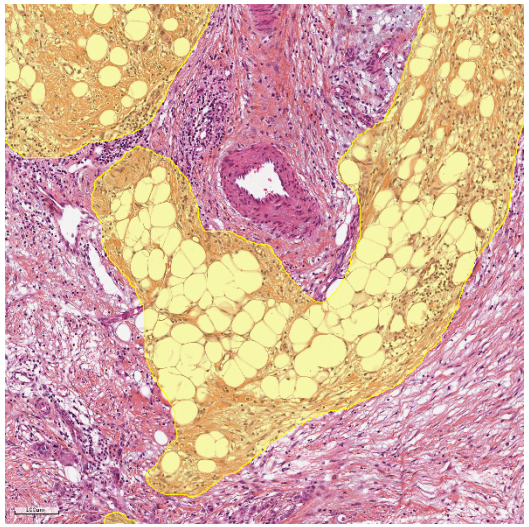


$$I_{RR} = \frac{R}{1 + G + B + \frac{(G-B)^2}{1+G+B} + R}$$

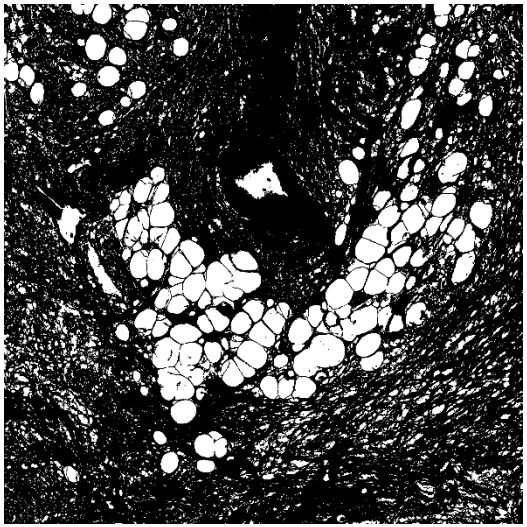
Qualitative Evaluation

3) Node Identification

Adipose tissue segmentation:

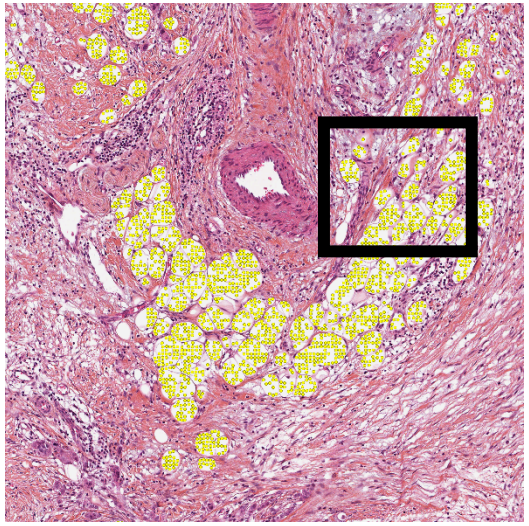


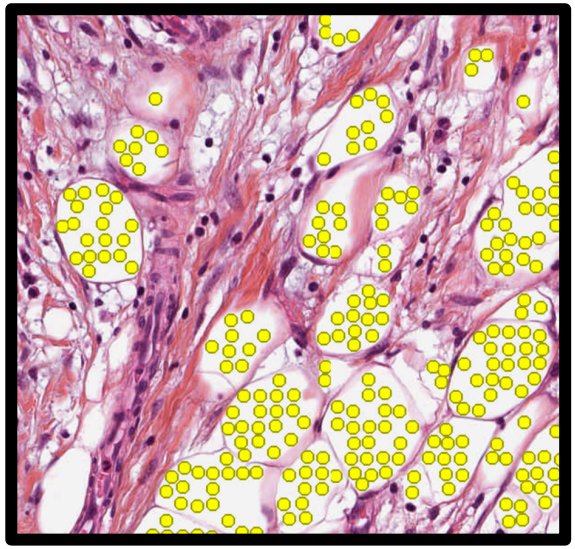
HES



HES>220

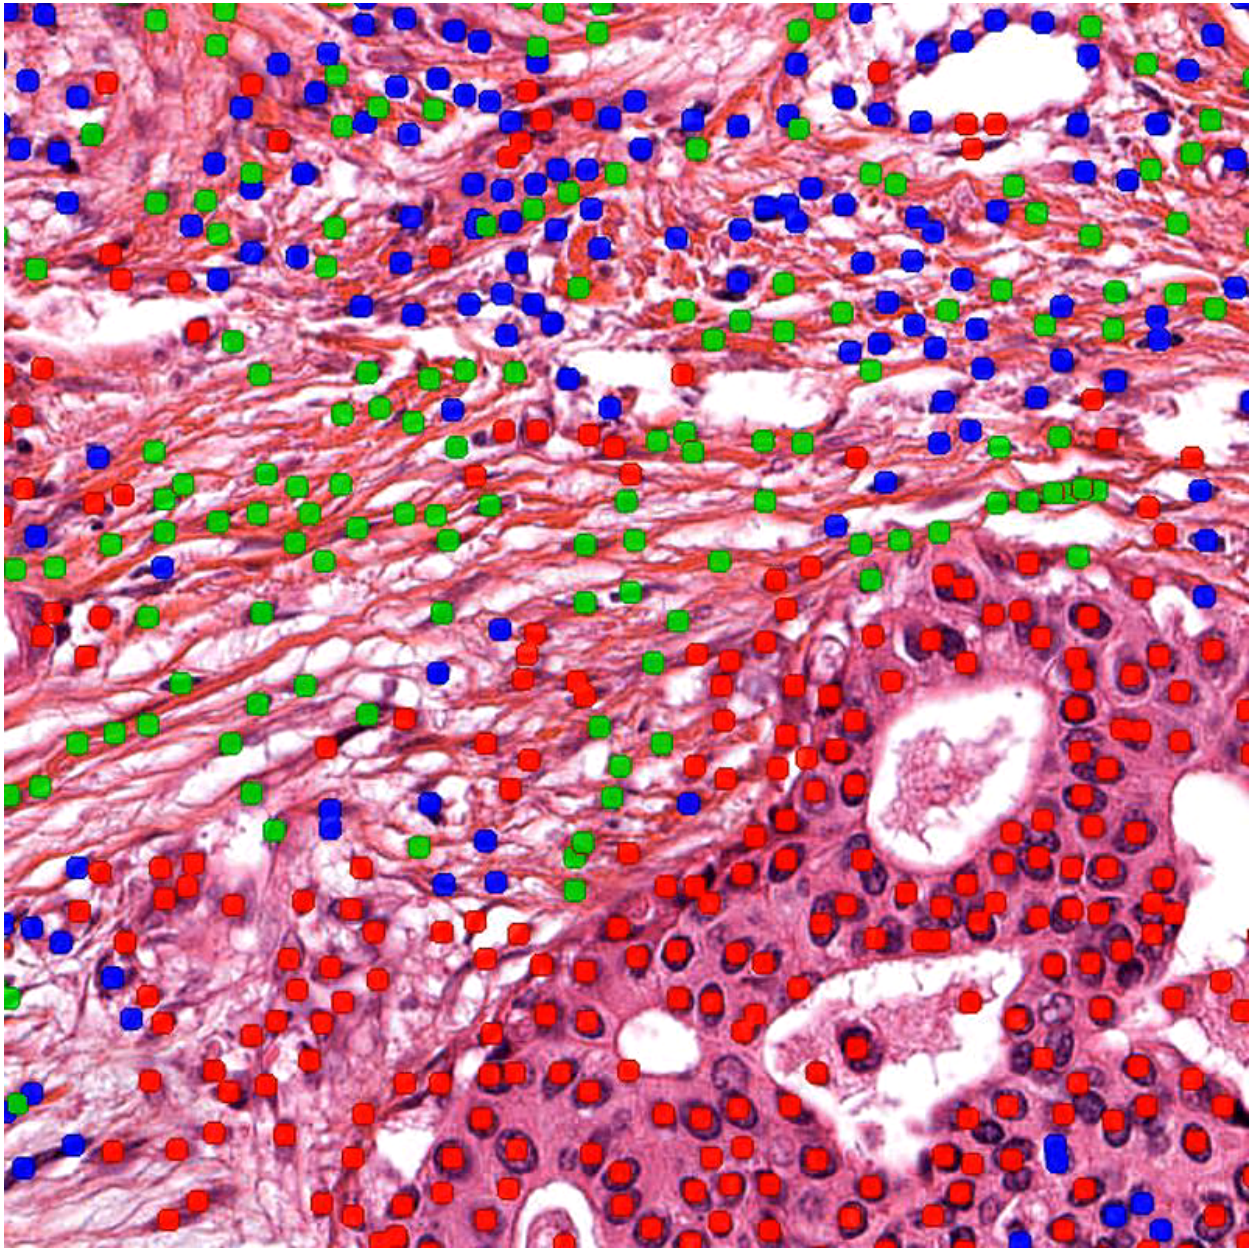
$Rec(Open_{10}(\text{HES>220}), SLIC)$





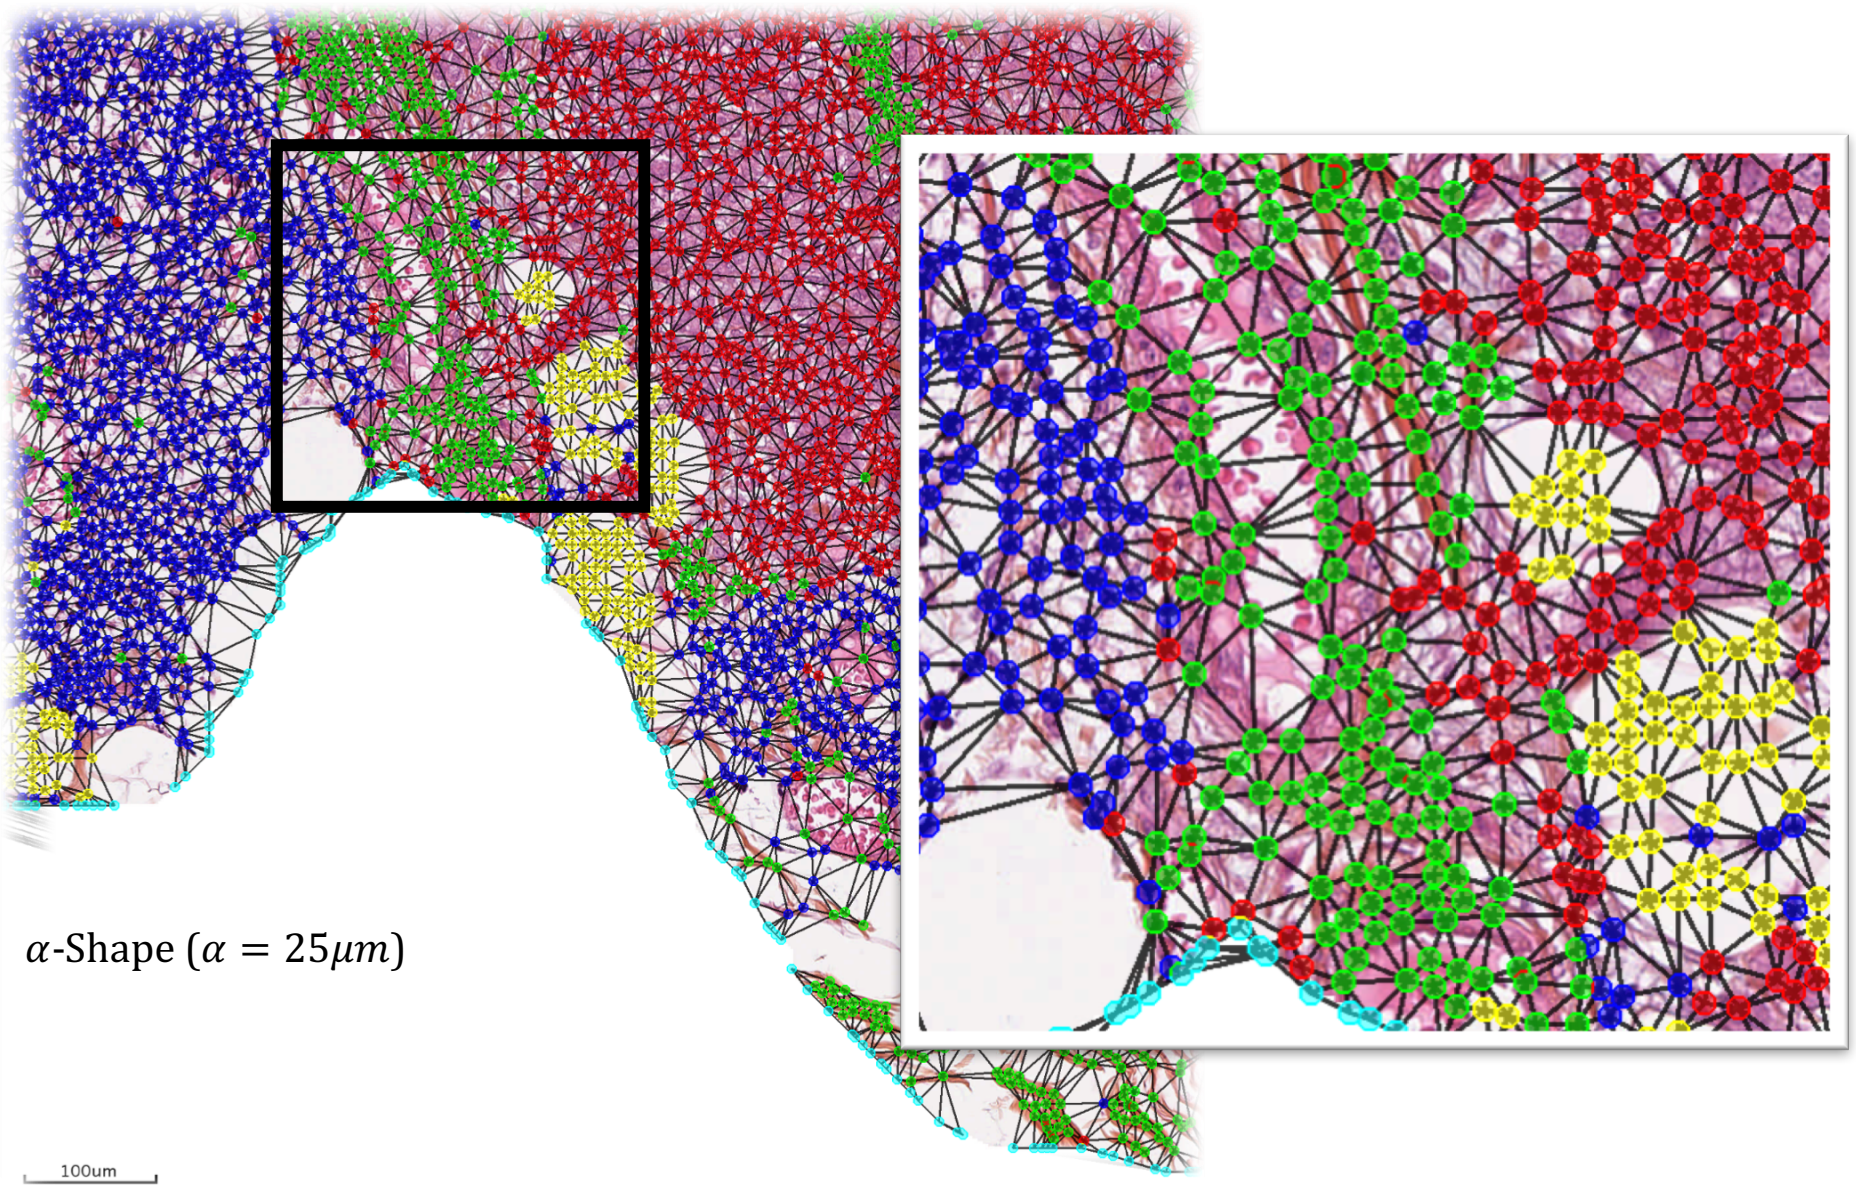
Qualitative Evaluation

3) Node Identification



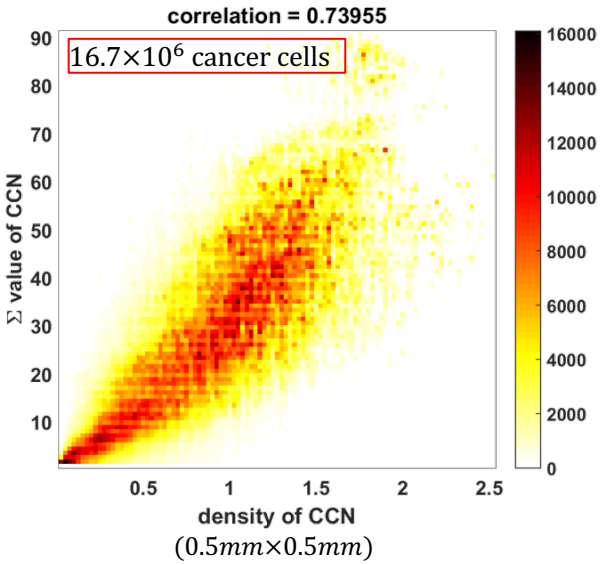
- Cancer cells
- Immune cells
- Collagen + Fibroblasts
- Adipocytes

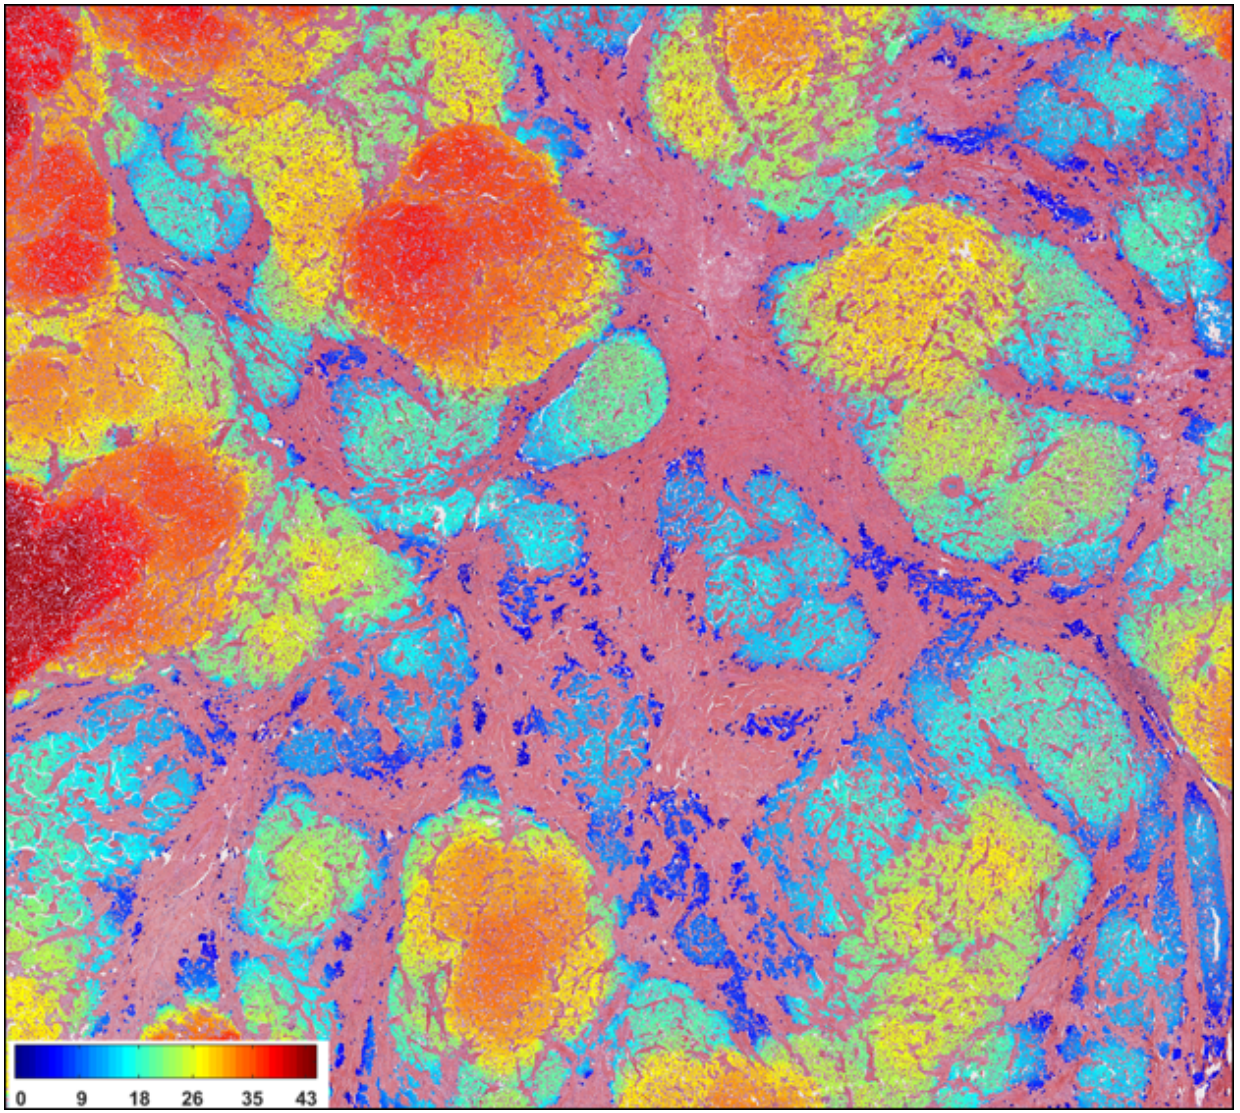
4) Spatial organization of histological structures



4) Spatial organization of histological structures

Expanse:





Expanse function:

$$\Sigma(G_X) = \frac{1}{N+1}\sum_{n=0}^{N} \Omega \circ \varphi_n(G_X)$$

$N = 5$

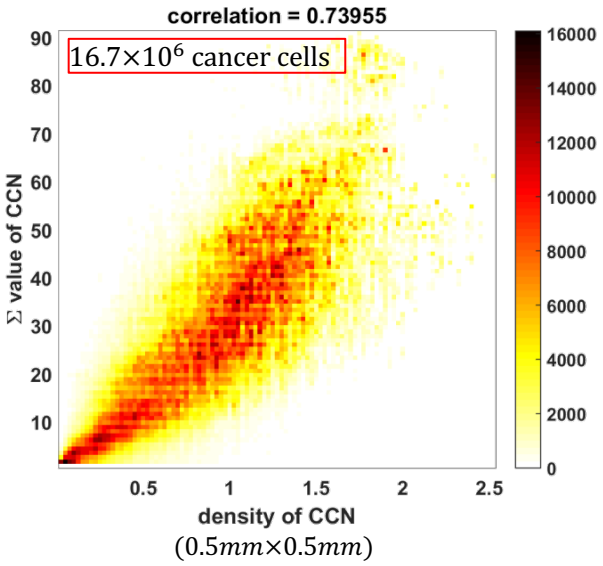
$\Omega \circ \varphi_n(G_X)$

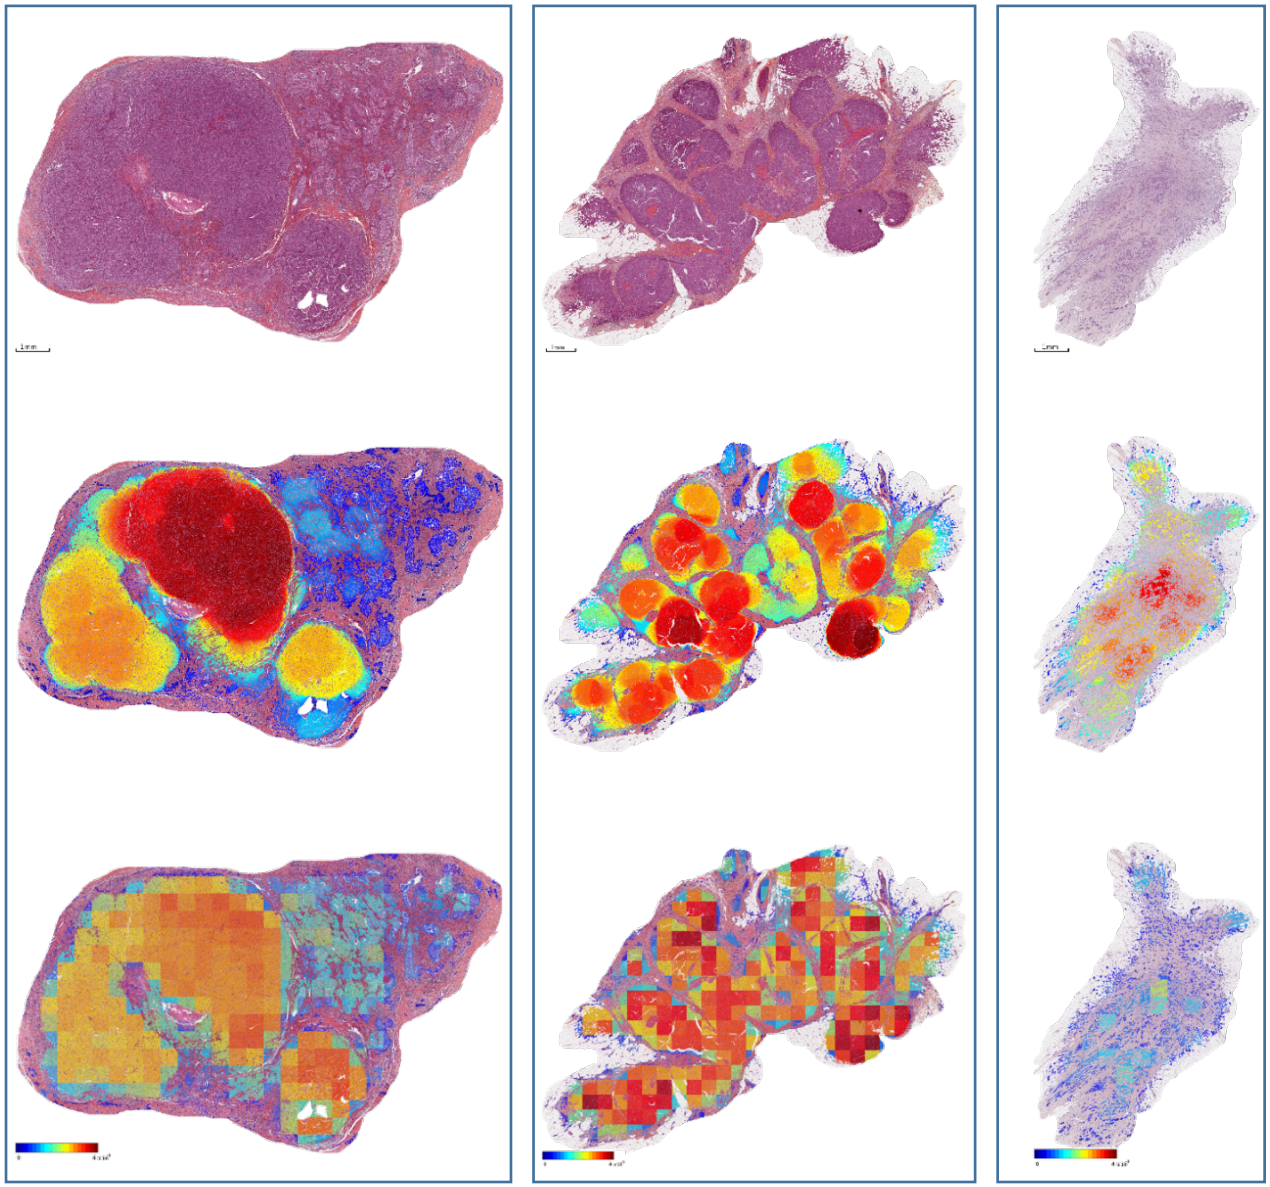
- $n = 4$

- X = cancer cells
- $\Omega(G) = \sum_{n=0}^{k} \gamma_n(G) \quad with \quad \gamma_k(G) = \gamma_{k'}(G),\ \forall k' \geq k$

4) Spatial organization of histological structures

Expanse:





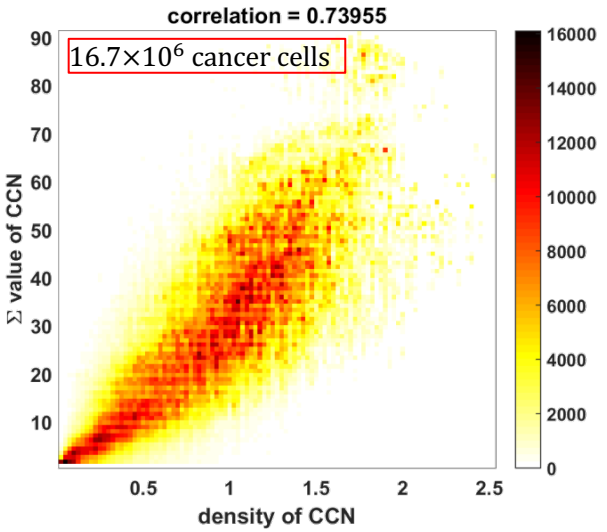
Expanse function:

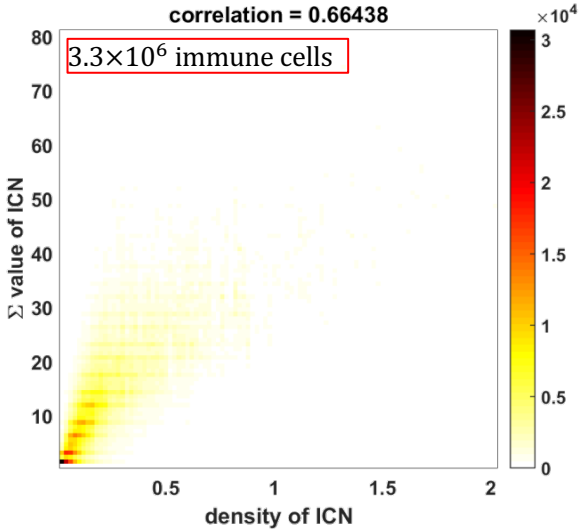
$$\Sigma(G_X) = \frac{1}{N+1}\sum_{n=0}^{N} \Omega \circ \varphi_n(G_X)$$

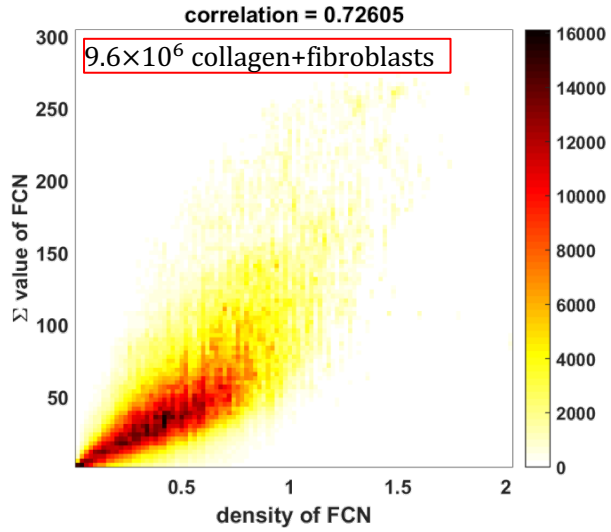
$N = 5$

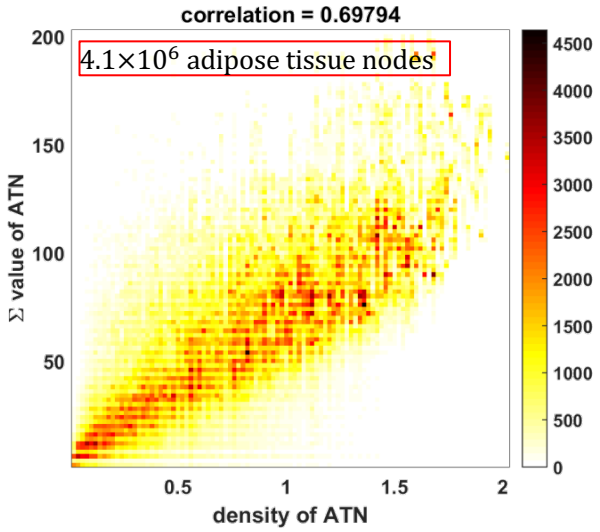
4) Spatial organization of histological structures

Expanse:









4) Spatial organization of histological structures

Sparsity:

Immune cell aggregates

Envelope immune cell aggregates

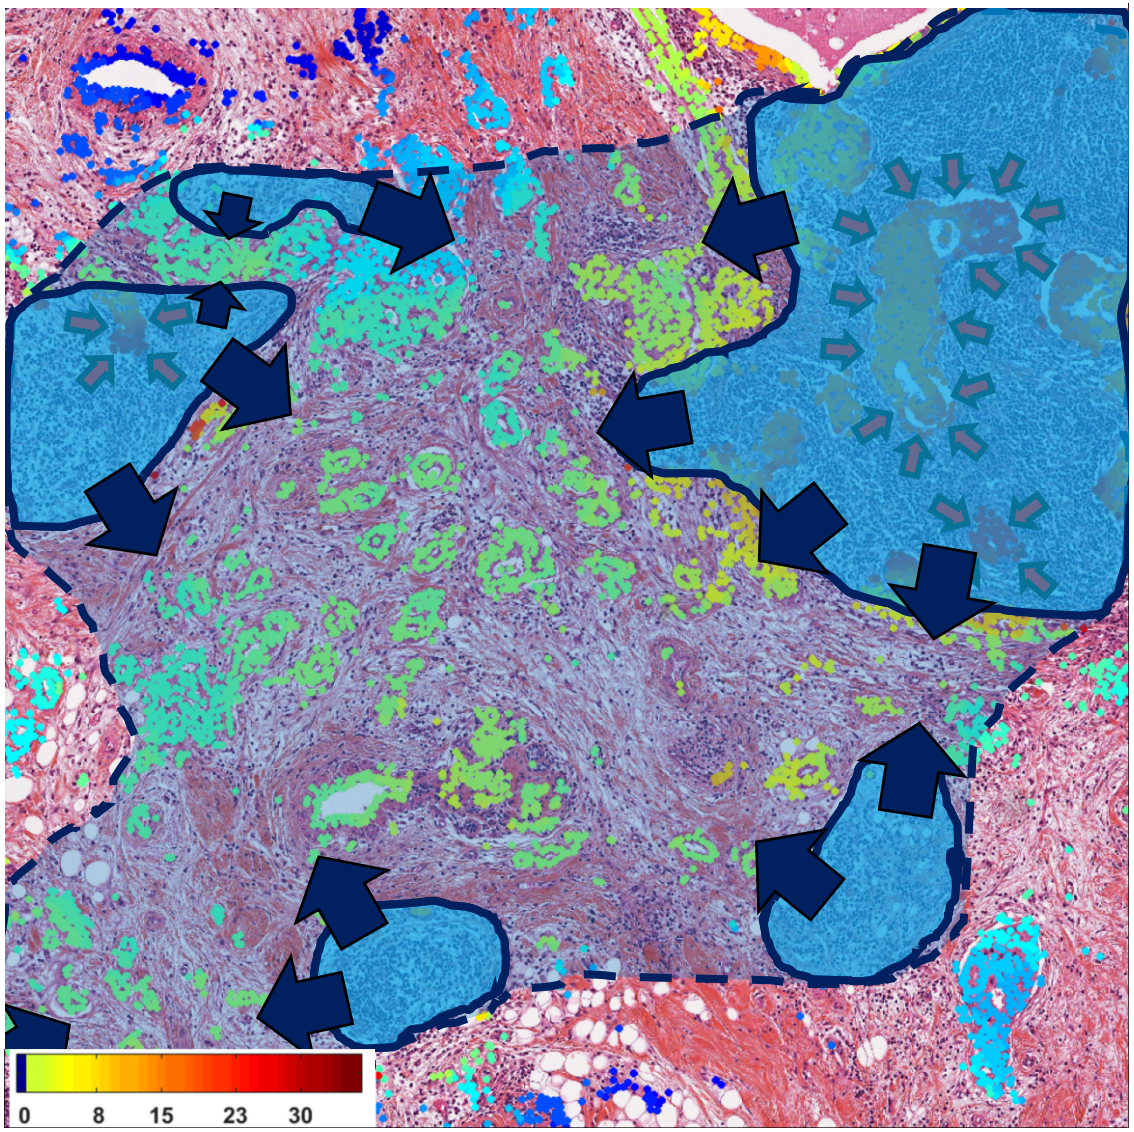
Cancer cells

- highly enclosed by immune cells
- surrounded by immune cells
- between distant immune cell aggregates
- free from immune cells

Sparsity function:

$$\Gamma(G_X) = \frac{1}{N+1}\sum_{n=0}^{N} \zeta \circ \gamma_n(G_X)$$

$N = 5$



$\Gamma(G_X)(G)$

$\zeta(G_X)(G)$

- X = immune cells
- Y = cancer cells
- $n = 4$
- $\zeta(G) = \sum_{n=0}^{k} \varphi_n(G)$ *with* $\varphi_k(G) = \varphi_{k'}(G),\ \forall k' \geq k$

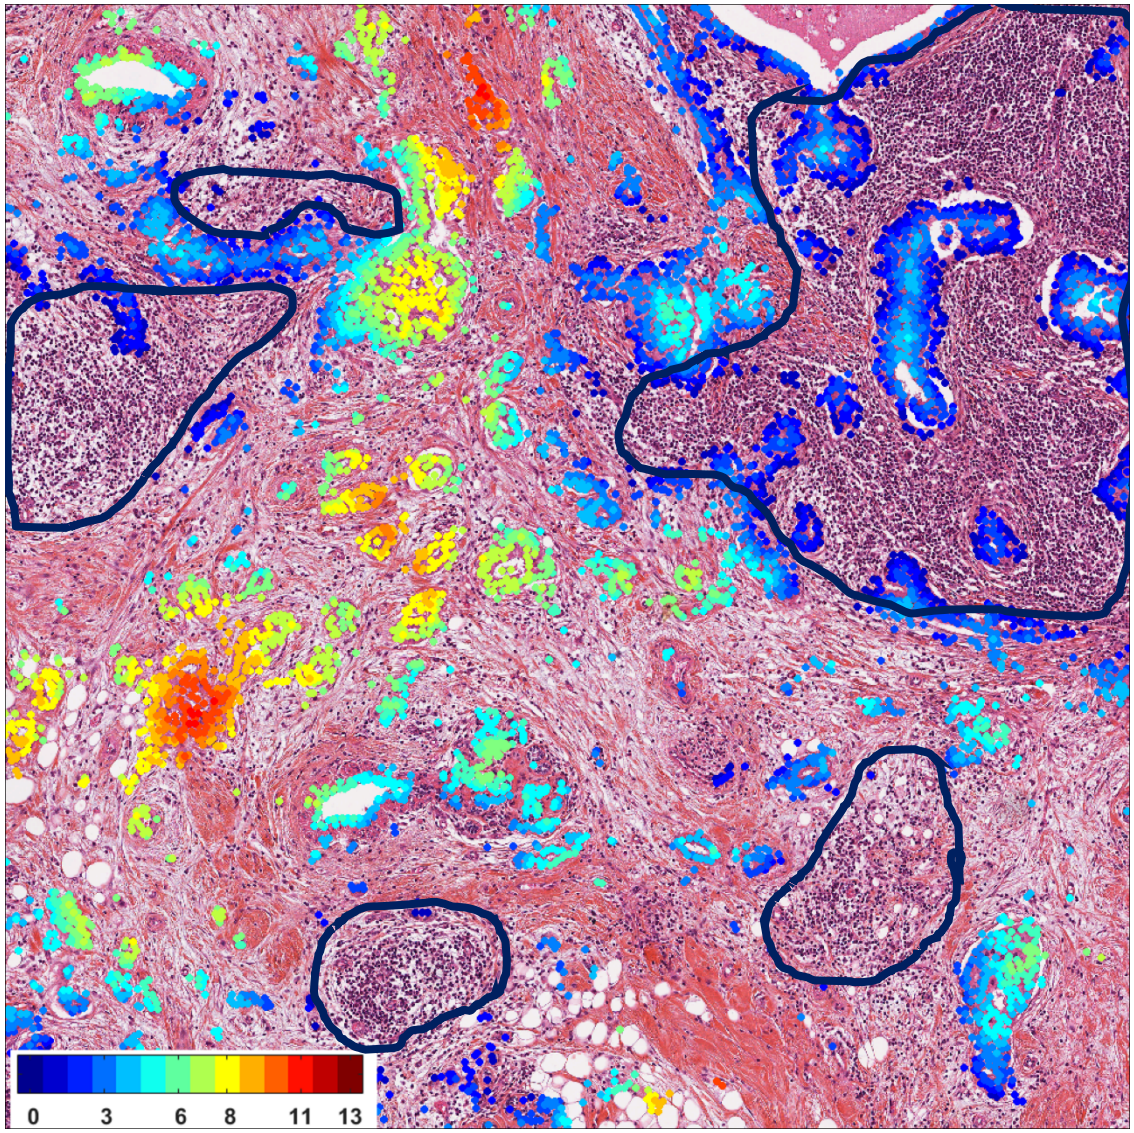
4) Spatial organization of histological structures

Relative distance:

Immune cell aggregates

- Cancer cells distant from immune cells

- Cancer cells close to immune cells



Average distance function:

$$\Psi(G_X) = \frac{1}{N+1}\sum_{n=0}^{N} D \circ \gamma_n(G_X)$$

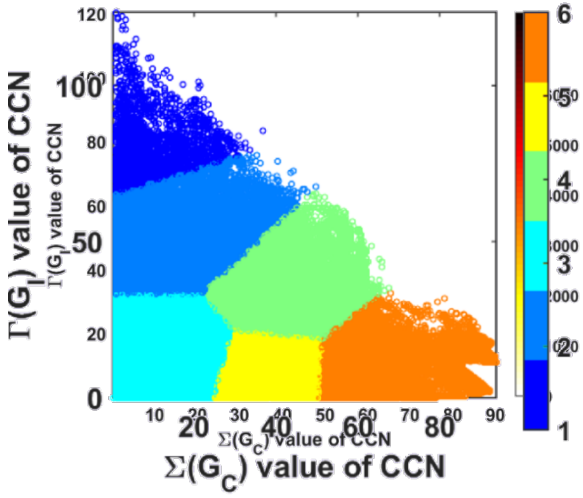
$N = 5$

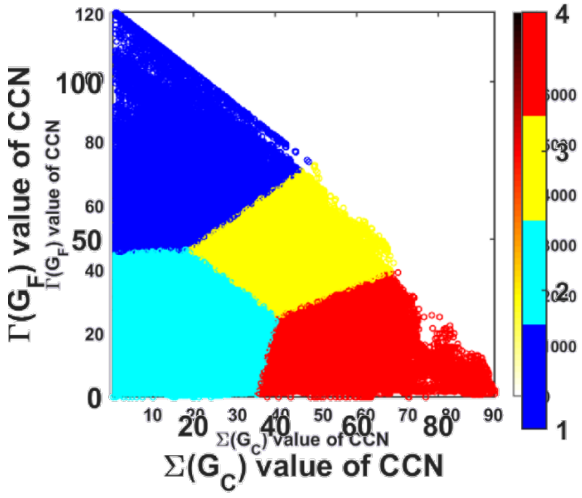
$D(G_X)(G_Y)$

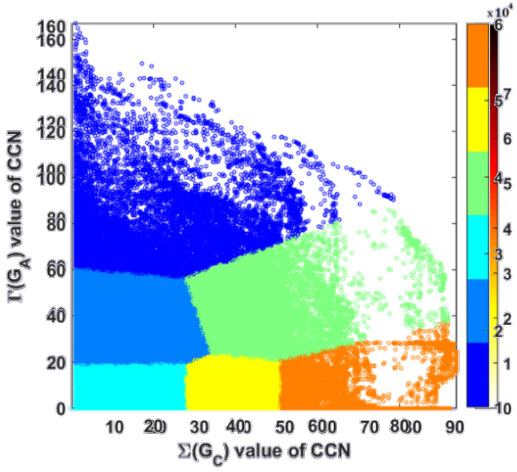
- X = immune cells
- Y = cancer cells
- $n = 4$
- $D(G) = \sum_{n=0}^{k} \varepsilon_n(G)$ $with$ $\varepsilon_k(G) = \varepsilon_{k'}(G),\ \forall k' \geq k$

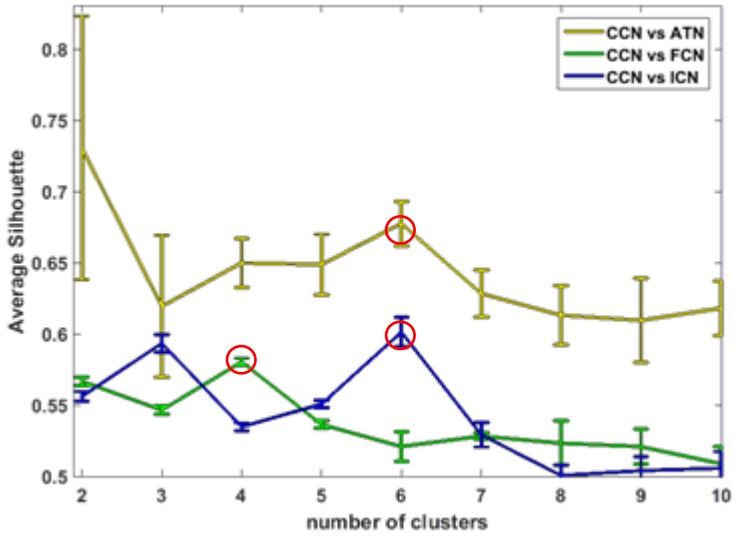
4) Spatial organization of histological structures

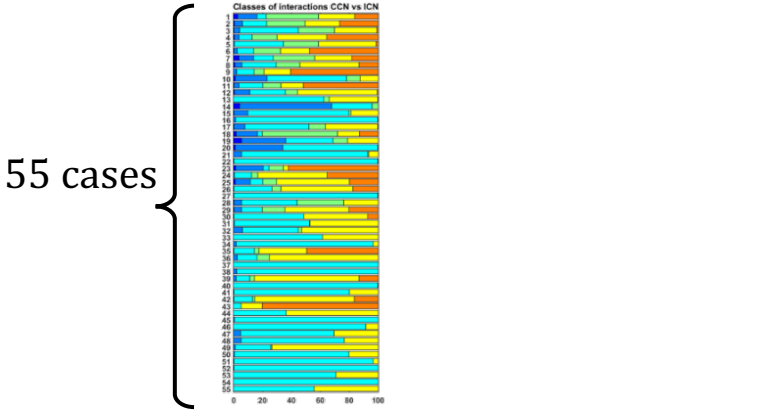
Interactions:





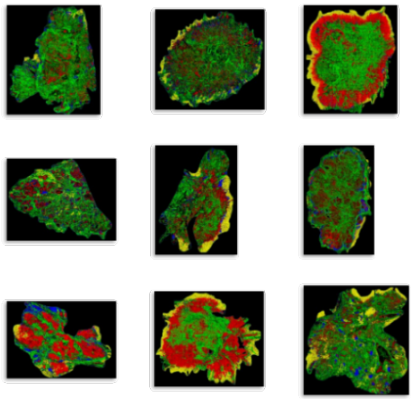


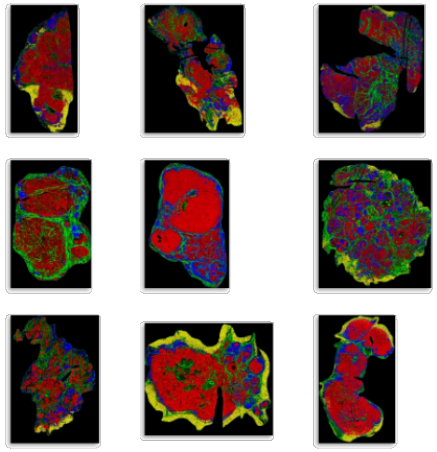




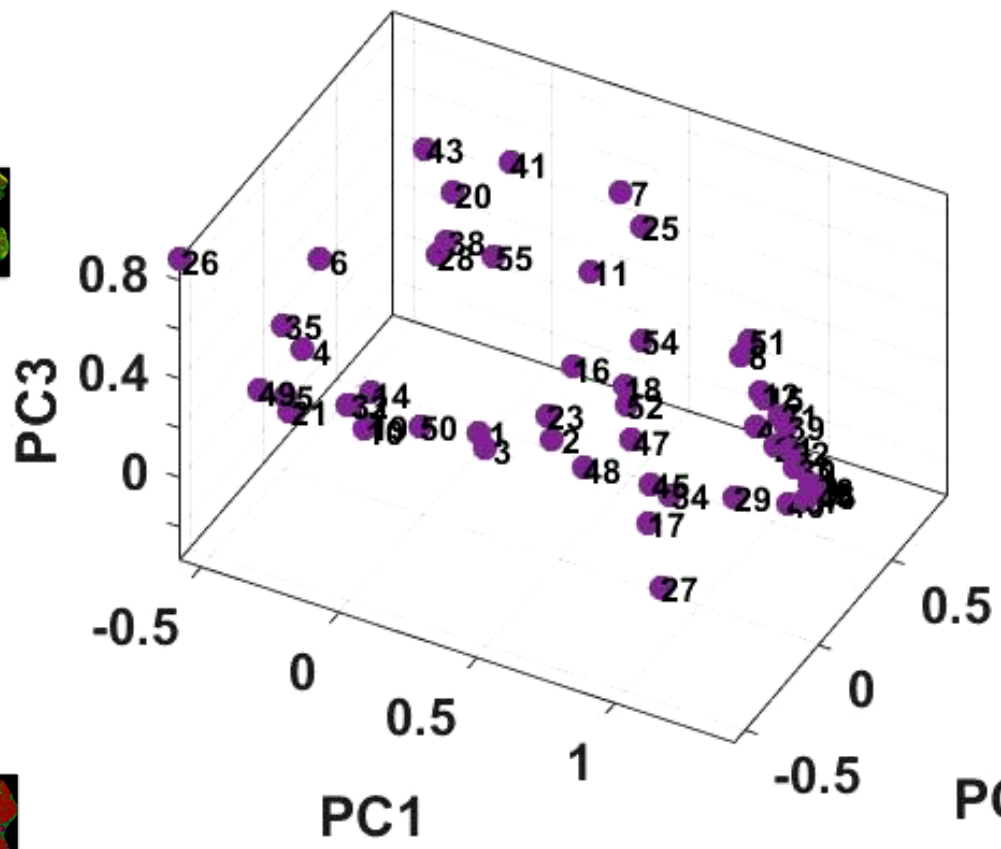
4) Spatial organization of histological structures

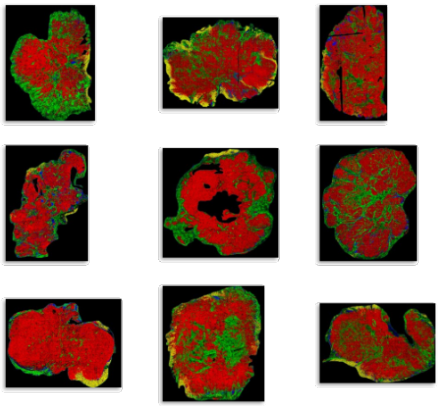
Interactions:

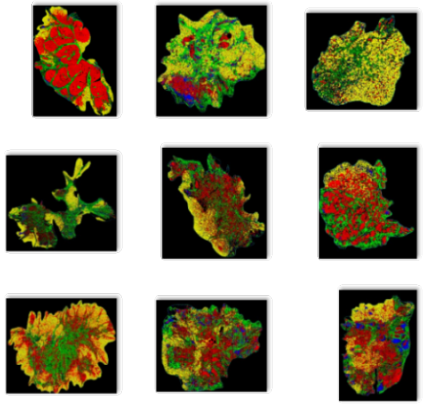




Principal Component Analysis







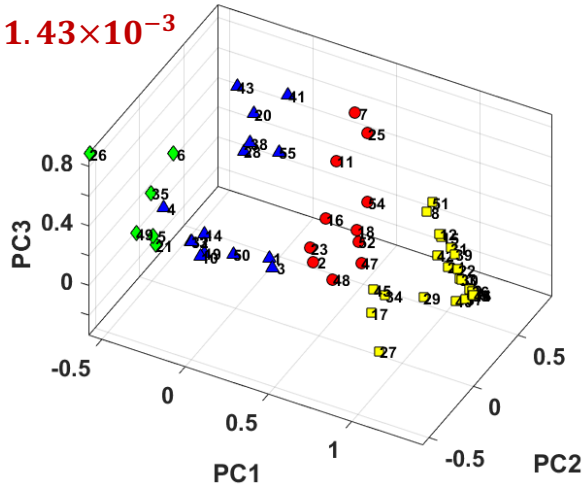
K-means clustering (k=4)

4) Spatial organization of histological structures

Interactions:

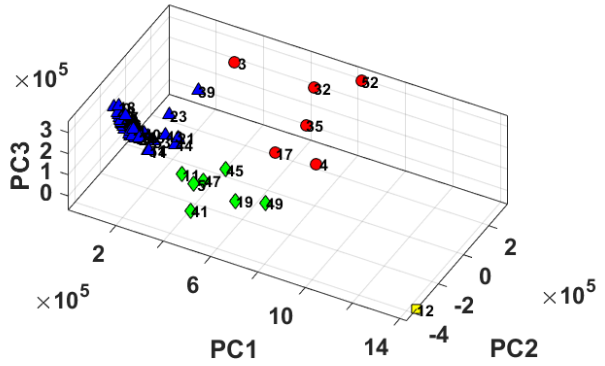
Spatial interactions parameters:

$PRESS = 1.43\times10^{-3}$



Node counting parameters:

$PRESS = 5.67\times10^{-2}$



Overall quality of the PCA : Predicted Residual Sum of Squares:

$$\mathrm{PRESS}_{M=3} = \left\| X - \tilde{X}^{[M]} \right\|$$

X : principal component coefficients
M : nbr. of components

➢ Leave-one-out cross validation

4) Spatial organization of histological structures

Outcome:

Tumor cell
- Density of tumor pattern
- Encloseness by TME_X
- Relative distance to TME_X

$X \in \{immune\ cells, collagen, adipose\ tissue\}$

Advantages:

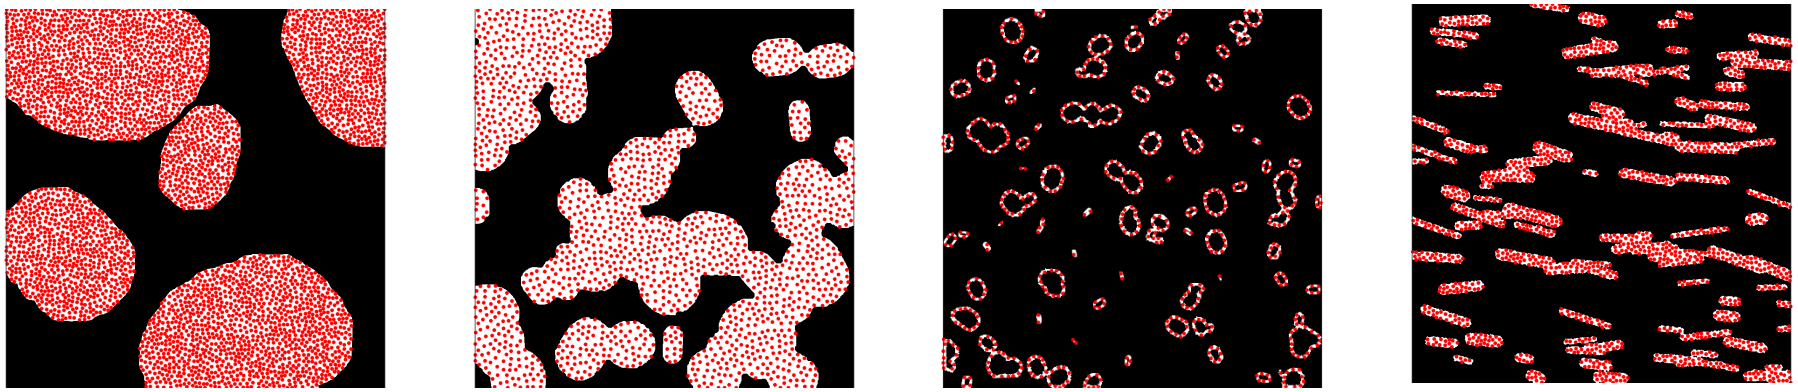
- Objective estimation of tumor pattern density (~~frame size~~)
- Estimation of tumor pattern size (~~connected component labeling~~)
- Robustness to noise (node identification errors)
- Low computational cost (WSI)

Limitations:

- Unsupervised learning (unlabeled data)
- Qualitative evaluation / prospective analysis

5) Simulation

Tumor Patterns:



(a) (b) (c) (d)

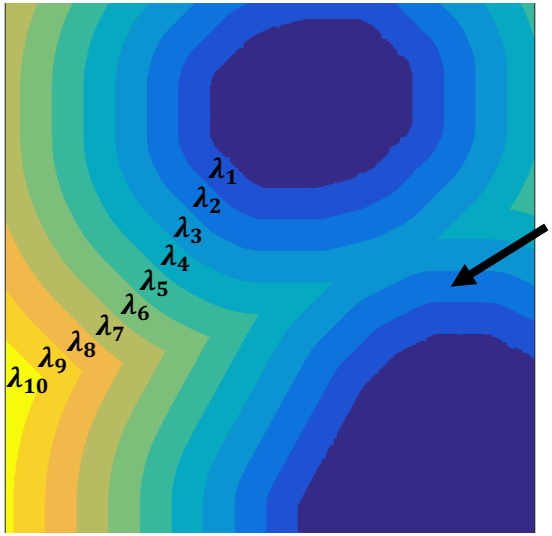
	n_0	d_0
(a)	$\mathcal{N}_1(7,2)$	800
(b)	$\mathcal{N}_1(40,8)$	100
(c)	$\mathcal{N}_1(85,5)$	40
(d)	$\mathcal{N}_1(100,5)$	40

$\mathcal{N}_n(\mu,\sigma)$: n random values generated from a normal distribution

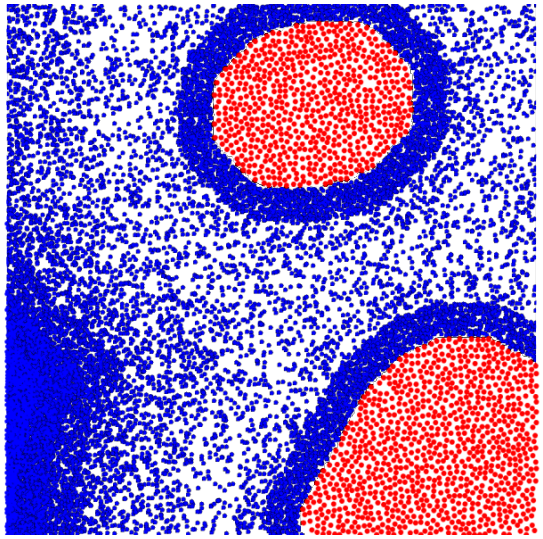
$\mathcal{U}_n(a,b)$: n random values generated from a discrete uniform distribution

5) Simulation

Tumor Micro-Environment:



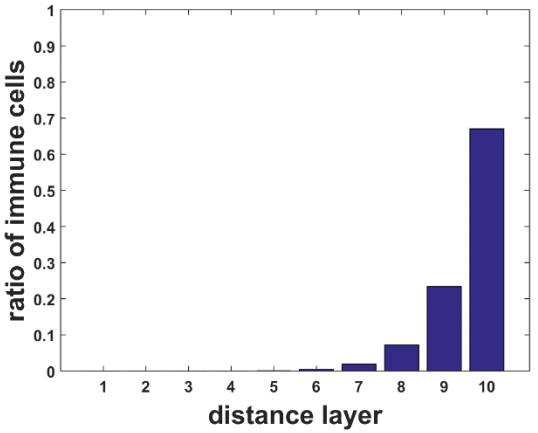
$n_L \times \lambda_i$ immune cells



- Distance map $(k = 10)$

$\alpha = 0, 1, 2, 10$

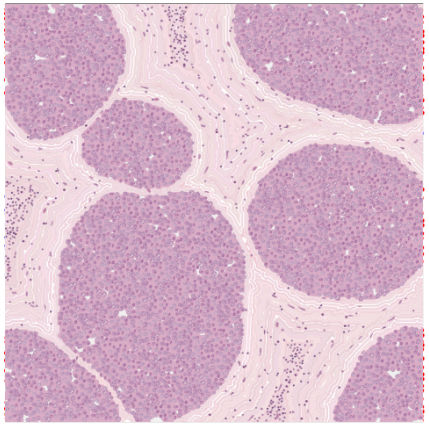
- k: number of layers
- Weight coefficients: $\lambda_i = \frac{i^{-\alpha}}{\sum_{i=1}^{k} i^{-\alpha}}$
- n_L: desired number of immune cells



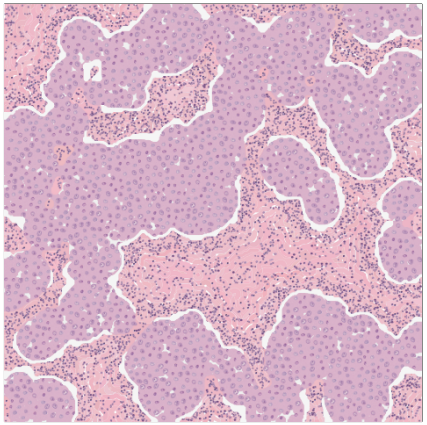
- $\alpha > 0$: immune cells close to tumor

5) Simulation

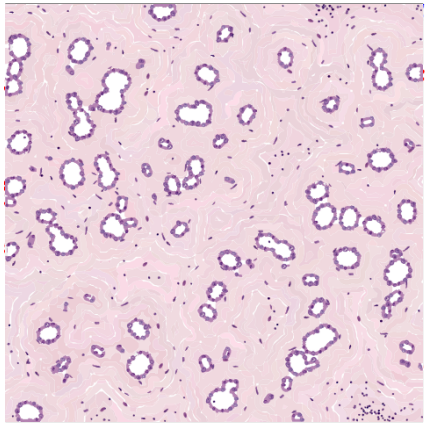
Synthetic data



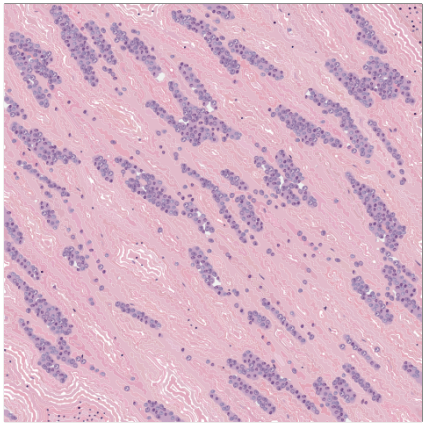
(a)



(b)

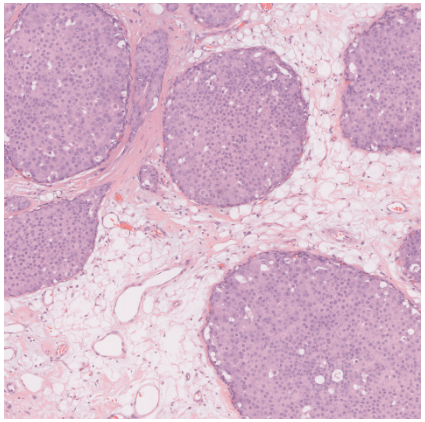


(c)

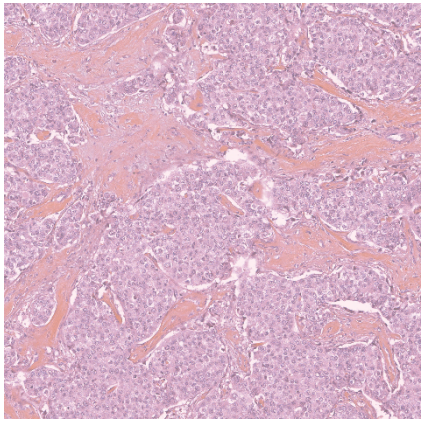


(d)

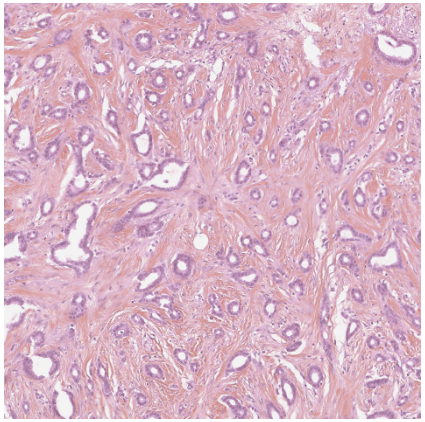
Real data



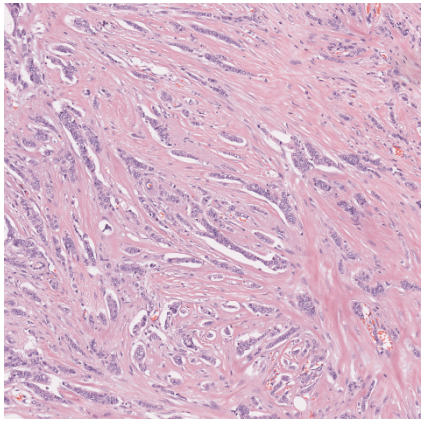
DCIS



IDC



TC



ILC

6) Perspectives

Graph-based Mathematical Morphology:

- **Significance:** different spatial point-set configurations
- **Comparison:** SSA / network analysis / spectral analysis / spatial statistics
- **Effectiveness:** stability of morphological functions *vs* noise
- **Variation:** different graphs / linking rules / parameters
- **Exploration:** new morphological functions / spatial aspects
- **Adaptation:** Spatial Point Pattern Analysis (GIS, astronomy, histopathology,…)

Tumor Heterogeneity:

- **Entities:** TME, IHC (+/-), FISH
- **Implication:** clinical parameters, cancer subtypes, gene expression
- **Comparison:** medical imaging parameters (US, Elastography,…)
- **Evolution:** tumor growth (culture / xenograft), 3D/4D
- **Anisotropy:** Collagen orientation (TACS)

Thanks

For Your Attention

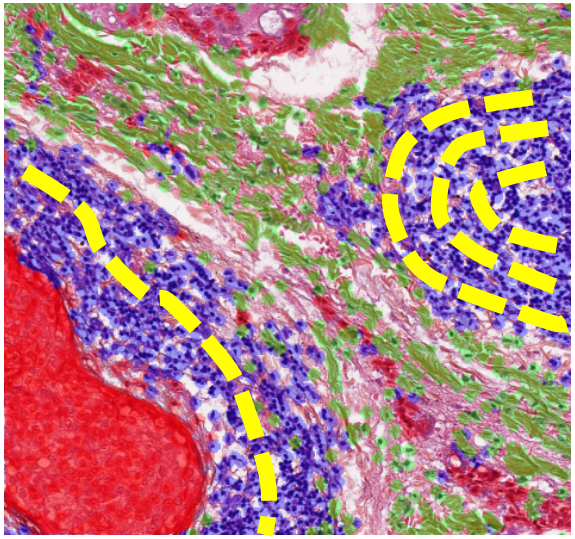
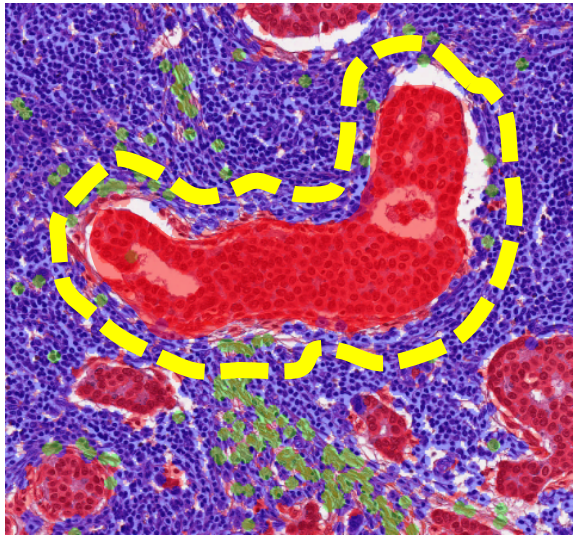
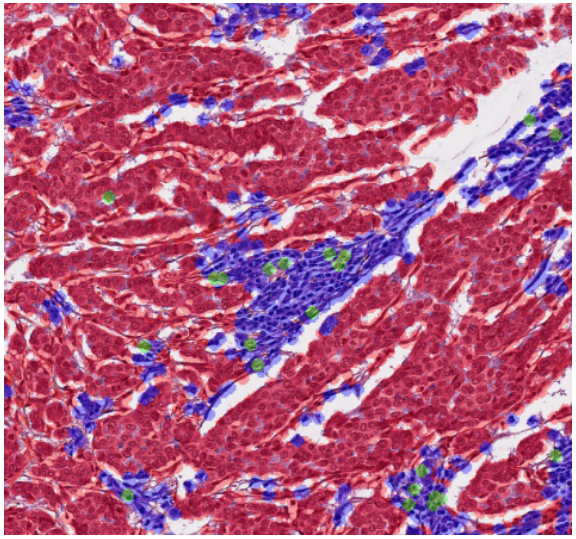
❑ Spatial heterogeneity of immune cells:

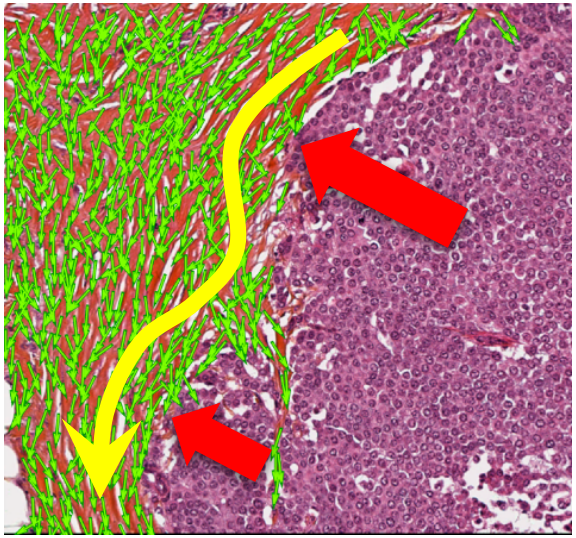


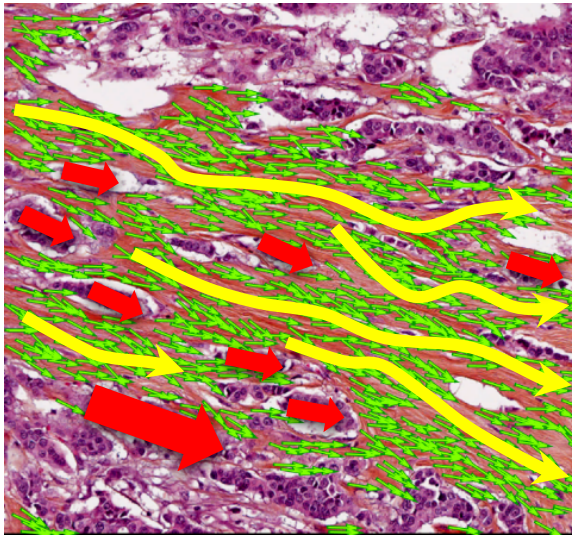


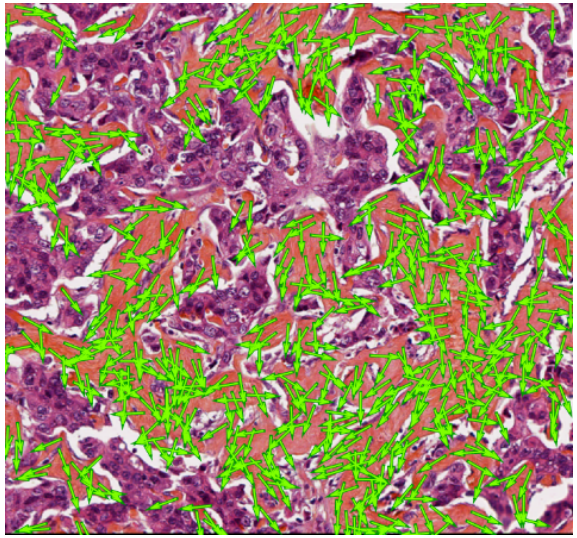


- **Relative abundance**
- **Spatial proximity**
- **Surroundedness**

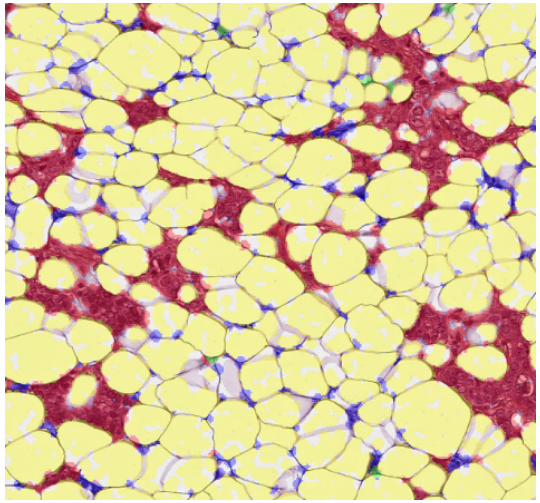
❑ Heterogeneity of the spatial organization of collagen fibers:

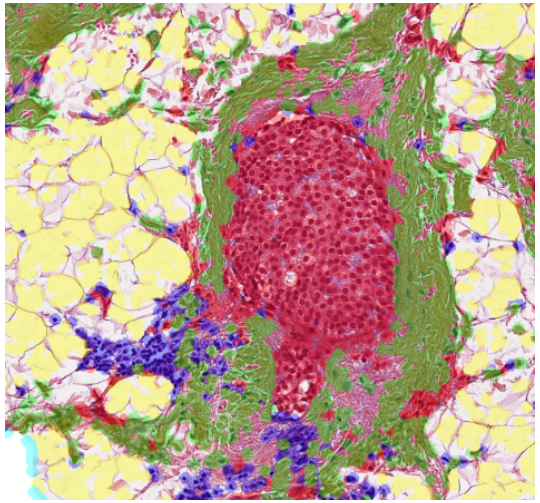


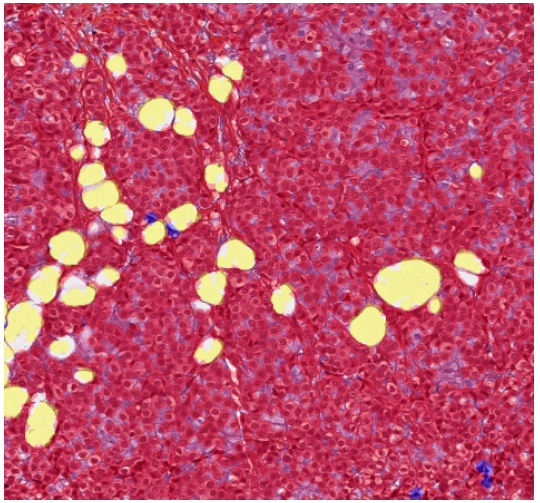




- **Orientation**
- **Density**
- **Spatial proximity**
- **Surroundedness**
- **Stretchiness**







Example of spatial heterogeneity of adipose tissue

❑ A model of collagen spatial arrangement:

- Reshaping (parameter $\boldsymbol{\gamma}$)
- Distance map
- Quantization (parameter $\boldsymbol{k}$)
- Dilation (parameter $\boldsymbol{R}$)

➢ Morphological of deformations of tumor patterns define various distance maps, which are quantized.

stretchiness	**thickness**	**density and spatial proximity**
		$\{k, R, \gamma\}=$ {1, 40, 60}	{1, 20, 30}	[illegible]

❑ A model of collagen spatial arrangement:

- Reshaping (parameter $\boldsymbol{\gamma}$)
- Distance map
- Quantization (parameter $\boldsymbol{k}$)
